you'd have a direct comparison to the Falcon's performance, vs a 32 bit
implementation.
However, one thing that the article did not prove, was that the
Falcon has been sufficiently 'crippled' to be worse than an A1200.

For the last few years, Atari has had a policy of:

Fish names for PC-compatible computers (though I can't remember any)
Bird names for their own computers (like Falcon)
Feline names for game products (like Lynx, Panther and Jaguar)

SB> the A4000/040 pretty much crushes the Falcon ;-).

In raw processing power. Nothing else.
(Except when the Falcon is using the DSP where it outperforms the A4000 too)

Test: Loading/Calculating/Displaying a 125*125 JPEG (24bit) picture.

GEM-View (using the normal JPEG libraries, caches on etc) 7.9s
Brainstorm DSP-JPEG viewer. (Old version, faster exists) 0.96s

Quite an improvement ..

SB> This pretty much proves that the 16-bit bus severely cripples the
SB> Falcon.
SB>
SB> Any questions? Feel free to ask.

Sure, I can ask you this for the FOURTH time ..

Benchmarking the Falcon against a 32Mhz 32-bit TT results in the Falcon being
50% of the TT's speed, as expected.

No re-calculations or different systems involved, just a comparisation between
a 32Mhz 32 bit system and a 16Mhz 16 bit system.

With your figures a 32 bit 16Mhz system would equal a 32 bit 32Mhz system ..
that's nonsense.

(BTW; you wanted the 3:d party developers list for the Jaguar, it's now
officially release .. someone posted it in comp.sys.atari.st)

Sounds like something's broken in the TT, doesn't it? He did say that
the A3000 came with a good memory architecture that allowed the 030 to
use all of it's features.

Operating a 68030 on a 16 bit bus removes the burst mode feature found
on the 68030. Does the TT support burst mode? If not, then it seems
to support the "feature" of having a 16bit data path. If it does, then
whatever benchmarks you're using to get the 50% speed figure from
are suspect.

Also, if you think that a DSP is going to help in a lot of apps and
crush an 040 box, tell Next all about it. They had a 030+56001 box
which was very sluggish. Their 040+56001 box had acceptable speed.
If a 56001 is going to crush an 68040, then I guess Next systems
didn't know how to use it. And all those developers who were porting
their Next software to the Falcon don't know how to use it.

A DSP is very good for certain applications and developers should
use it's features, but if they don't use it, then the dsp is doing
nothing and you, the end user doesn't see any speed improvement
in your programs.

I'm sure you know a lot more about fabrication than Motorolla. What
tests do they perform on EC and RC plastic? All their silicon chips
go through the same tests, with the EC components not tested for
MMU functionality in the 030 and 040 chips.

What is the normal pin package for 68020 and 68030? PCC, PLC? What?
Do you know what plastic packaging Stefan is talking about?

: 68EC020, notice the EC which means that the possibility that the processor will
: fail after a few months is quite big ..

[... Sarcasm mode on ...]

Where did you get this piece of information from? Alt.FolkLore or from
Intel.Only?

I'm sure all those devices that have Embedded Controls are failing all
the time? Hmmm... You're right, all those airplane crashes are due to
Motorola and their crappy chips.

That's why everyone is switching to Intel! They don't make junk like
Motorola!

And I'm sure lots of Amiga and Atari ST owners who have 680ec30
accelerator boards will tell us how crap the EC components really
are. Every A4000/ec030 has been returned to their dealers with a
dead cpu.

[... Sarcasm mode off ...]

EC Components may have some tests ommitted, which makes for a cheaper
price. The 030 and 040 EC chips do not have the mmu checked. There
are 040 models without a floating point unit. Testing costs money!

If you want to worry about anything, worry about the 16mhz 68030 in
the Falcon. In binning, chips that fail the higher spec test go into
the lower spec bin and tested until it passes a test. Often, the lowest
grade chips have other manufacturing problems.
It's not a good idea to go with the lowest grade chip from any
manufacturer.

This '486/66 vs Falcon benchmark was the stupid statement that started this thread. So, a Falcon with an appropriately re-written DSP Mandlebrot generator can build a fractal faster than a '486/66, which CRUSHES the life out of a Falcon for all real-world uses. When are you going to take your head out of the sand and realise that a faster CPU is more useful than a zippy co-processor that isn't useful for "everyday" operations?

You keep saying the 16Mhz Falcon (with its crippling 16-bit bus) is adequate because _there_isn't_anything_else_ available. Like the Amiga users who say memory protection isn't necessary, you're turning something you don't have the option of using into a feature.

Sure, but most of the programs that need CPU power at the moment are indeed
looking into DSP subroutines ... (Crunchers/Compilers etc)

If you had a Jaguar line which was making money and a Falcon/ST line
which was was losing money (or at best, just breaking even), where would
you spend your money?? Jaguar, of course. Let's make it better. Let's
get even better software, etc.

The Falcon being a niche computer doesn't help. (It's easier to find Atari
products in music stores than computer stores. When Joe Consumer goes to
buy a computer, will he visit a music store or a computer store? Even if
he wants the computer for music/MIDI, the sales droids will steer him
to an IBM or MAC machine. "This is just what you're looking for".)

Competing with the MS-DOG world is like trying to stop an avalanche.
To make the Falcon/ST competitive, Atari must advertise the hell out of
the machine. (Remember how Atari used to advertise in the past? Anyone
remember the Alan Alda TV spots??) They must build a dealer base of
COMPUTER dealers. Not just music stores. Atari's been building up their
dealer network for how many years??

Well, nobody on NeXT programmed games. But a DSP is very well suited for games.
You can make it do the music (8 voices or more) AND do the 3D calculation stuff
for those gouraud-shaded polygons.
The game-preview I saw from Eclipse at the Cebit was quite nice and fast. And
they didn't even use the DSP. Most of the calculation time was used for 3D, so
in the DSP version the game will be very nice and fast.

It's right that most of the business software for TOS machines comes from Germany. However, Atari computers are NOT considered to be business machines in Germany, at least not by the public ("Atari? Hasn't that once been a videogame company?") is a typical statement.

And you can also hardly find any companies who have Atari computers in their offices. As I am german, I think I know what I'm talking about.

|> Marketing does make the difference, you're right! But I disagree on

|> >>[...] The MS-DOS machines appear to be the ones that are 'not competitive'.

You once mentioned a certain benchmark that you saw where the Falcon was much faster than the 486/66. It would be fair if you made clear what kind of benchmark that was and whether the Falcon's DSP was used or not.

Everybody knows that the performance of 486/66 is far better than the one of the 68030/16.

Chris.

I can explain why it was (is?) slow: The DSP was only equipped with 8kword
(try do squeeze in program AND data in 8kword), and since the NeXT used
display-postscript I can imagine that it felt sluggish.

>A DSP is very good for certain applications and developers should

Yes, that's right, but things that is standard (ie. not optional) has a
tendency to be used.

In article <H.eg.teliicsKCzM@semprini.waterloo-rdp.on.ca>
cherborth@semprini.waterloo-rdp.on.ca gets serious and notes:
>I guessed you missed that bit of market analysis that showed computer
>sales _rising_ over the rest of this year.

Analysts are great fun, because they can take just about any
data and twist it around to the benefit of whoever's buying
the final report. Generally, the market for computers is down.
Also generally, we can expect the market to go up. I find
myself in agreement with you, although I have not seen the
specific analysis you are referring to.

>I guess you missed all those posts by myself (and a cast of thousands)
>showing how the aforementioned '486 absolutely CRUSHED the LIFE out of
>the Falcon when it came to real work... like raytracing. :-)

Nawww -- remember how we discussed that good software takes time?
Or did you see the posting that someone *was* working on a raytracer
for the Falcon? The benchmark shows that the Falcon is capable of
outperforming a '486 running at 66 MHz, and as updated software is
written to make use of the new hardware, it will be easier and easier
to prove.

>I guess you missed all those posts (and all those many, many magazines
>at the local <whatever> store) showing that a _complete_ '486dx/33
>system _with_ the monitor is the cost of a Falcon030 _without_ a
>monitor.

But that system *doesn't* have the power of the Falcon system. It
takes a '486 running at 66 MHz with a whole buncha EXTRA COST GOODIES
(Midi? LAN? FCC Class B? Microphone Input? Sound other than a beep?)
to come close. And I've been generous, too, because the '486 ran the
benchmark in 6 seconds, while the Atari ran the benchmark in 4 seconds:
I'm willing to ignore the extra two seconds needed by the '486 and call
it "comparable".

>Or maybe you're just ignoring them since you don't believe that anything
>could be better than the Falcon.

For the price, and value received, and for my use, you are correct.
If money were no object, I'd consider a workstation of some sort.

> How do you feel about the new AV Macs?
>They're based on a nice fast chip (68040) and have a nice fast DSP which
>is probably better than the one in the Falcon (from the specs it looked
>a bit better; I haven't seen anyone claim either way though).

Are they compatible with my existing TOS software <grin>? Quite honestly, I haven't looked at the new MacIntoshes because I wasn't too happy with the MacPlus I used for several years. The operating environment was smooth, but slow and got in the way many times. There have been upgrades in the intervening years, but the basic overall look and feel hasn't changed much ... and if you check over in Mac *.advocacy, you'll find a lot of yelling and screaming about how awful System 7 is. I suspect I'm not missing much by ignoring Apple's offerings....

>Oh, I guess PC owners are somehow prevented from doing exactly what
>you've been _forced_ to do... ie, keep using the same software for the
>better part of a decade. Does Mickeysoft somehow _force_ everyone to
>buy the 'latest' version? I'll bet you there are more WordPerfect 5.1
>users than there are Atari users, and that's an 'old' version lacking
>many of the wonderful (?) features of WP 6.0.

Calamus has upgraded. STalk The Market has upgraded. Card File has upgraded. Even ST Writer (public domain) has upgraded. Sure, I keep using the same applications (I *like* a good piece of software), but they are updated at intervals to add new functions and ex-ter-min-ate the odd bug or flakey feature.

>Then, maybe, just maybe, people will have brains and STOP USING DOS.

You mean MS-DOS machines, eh? Do you suggest Apple? Atari? Amiga? Silicon Graphics? Hewlett Packard? What do you think the next big platform is going to be?

>No they're not; they never started. You keep ignoring the people saying
>that the 'great Falcon demo' that was being discussed was put on
>completely by user group personelle; not a single Atari worker was present.

At the San Diego Computer Fair, they *were* in the San Diego ACE booth. However, the booth was divided in half, with the ACE members running an 8-machine MIDI-MAZE (the highlight of last year's show and this year's show, according to the organizers, winning the "most interactive" award) on one half.

In the other half, Atari's official show booth was set up, and the music demo was being shown by a software house. It is my understanding that an Atari employee was at the show (so says my dealer), but I didn't chat with him/her.

>> In another response, I've copied a question posed to Bob Brodie of
>> Atari and his answer relating to future Falcons. In short, Bob says
>> there will be more of them coming down the road.
>
>That's the line he's been feeding us for over a year; still no plans to
>actually _release_ one though.

They're concentrating on the Jaguar right now, aren't they? They can publicly promote the next development in the Falcon series once they've got the Jag off the ground.

In article <H.eg.tpT1M3mfpfQ@semprini.waterloo-rdp.on.ca>
cherborth@semprini.waterloo-rdp.on.ca continues to expostulate with:
>This '486/66 vs Falcon benchmark was the stupid statement that started
>this thread. So, a Falcon with an appropriately re-written DSP
>Mandlebrot generator can build a fractal faster than a '486/66, which
>CRUSHES the life out of a Falcon for all real-world uses. When are you
>going to take your head out of the sand and realise that a faster CPU is
>more useful than a zippy co-processor that isn't useful for "everyday"
>operations?

As a system, the Falcon performed *better* than the '486 system.
It's only a matter of time before there is software available for
the Falcon to take advantage of the available power in real-world
applications like ... um ... raytracing? Is raytracing a real-world
application?

>You keep saying the 16Mhz Falcon (with its crippling 16-bit bus) is
>adequate because _there_isn't_anything_else_ available.

A crippled Falcon is outperforming a '486 running at 66 MHz? Just
imagine what the *next* Falcon development will be like! Wow!

> Like the Amiga
>users who say memory protection isn't necessary, you're turning
>something you don't have the option of using into a feature.

I'm willing to admit that things aren't perfect for the Atari
platform right now. And I'm fairly certain that upcoming software
and hardware developments will address the problems that exist.

No.

|>
|> RH> No. The 68030 is far superior to the 68000.
|>
|> Jupps, and to the 68020.

Yep, when operated in the environment that Motorola designed for it. I.E. NOT A FALCON.

|>
|> RH> Okay Rickard, what's the deal with you. WHY YOU WANT TO BE SO DAMN
|> RH> IGNORANT? I already explained this to you, and it's not flipping
|> RH> screen basepage.
|>
|> So? All the HAM8 animations I've heard about
^^^^^^^^^^^^^^^^
Well, now you are hearing differently.

|> are of the type "flipping screen
|> basepage" (or the likes) ... That's becoz you CAN'T put a new object on the
|> same background without having to re-calculate A LOT!

FALSE. When I talk animation I am talking about decompressing delta-frames.
All the 'recalculation' needed has already been done. It's not page-flipping, you
write to de bitplanes. AND BTW, read below.... there's a way to move objects
in HAM8 without recalculating a thing.

|>
|> RH> Well, if you do what team -17 guy told you (for got his name, Steven
|> RH> Bolberg?),
|> RH> you won't have any problems.
|>
|> Yeah, you'll need a VERY FAST processor to be able to do all that re-calc while

|> doing the animation!

YOU DON'T! He mentioned a method where you don't need to recalculate anything
at all. Why you refuse to accept it? It's simple to understand or is it
that you are not the programmer you want us to believe?

|>
|> RH> Typcial Dpain will have fringes, when you stamp the brush it looks
|> RH> beautiful. Far superior to the Falcon's "True color mode"
|>
|> Seen one?

Working with video and raytracing/animation programs for more than 2 years
now clearly have showed me that having a 64k color palette is not enough
for video applications. Intensities are too limited (256 intensities for a 24-bit
palette for the RGB's vs. 32->64 of the Falcon).

And BTW, was is the highest resolution of 'true color'? Isn't it 320x200 or
320x400? I can do ham8 on 320x200, 640x400, 800x600, 1280x400. More with overscan.

|> RH> |> Last I heard from Sky One's TTV was 32 bit.
|> RH>
|> RH> Ah, okay. You just believe in what you want. I understand you know.
|>
|> Why shouldn't I believe in what I read there?

Well, because ATARI's specs differ! And BTW, you could read the
US National Enquirer then, I guess...

|> That's where I read about the
|> CD32 ... Maybe I shouldn't beleive in that one either then .. ?

Ah, I guess that if in Sky One's they say that CD-32 has
kick-butt capabilities you'll believe it then?

|>
|> RH> Well Rickard, you are not showing... whatever wisdome you supposedly
|> RH> have...
|>
|> Good. Don't want you to feel incompetent.

You are not making me feel incompetent. But you are starting to show
that perhaps you are.

Ok, I'll start posting out then the things a base Falcon can't do
against a base A4000/040. Why? Well, since the price doesn't matter
eh Rick?

Feel like losing again?

Kendall, thanks for posting those numbers. No flames to you,
you did the proper thing. Now some flames to my 'friend' Rickard:

See that the Falcon ALSO has some problems with a lot of colors?
Looks like the cache didn't help that much.

52% improvement for first test.
40% improvement for second.

The 'mythical' 100% goes down again :-)

Cool. Kendall, no flames to you. I think the Falcon looks like a nice
machine for music. It's just that I have to clarify things up where the A1200
is concerned.

Congratulations Heiko! This is all much more objective. 57% Sounds about right, considering that the Falcon's '030 should benefit more from the cache than my machine (because of the 16-bit datapath).

Using these new numbers doesn't favors the Falcon against the A1200. Congratulations on doing a 'true benchmark.' (Look that I didn't nit-pic on your drystone benchmark.)

|> take it out of the box and put it next to a Falcon out of the box, it
|> is slower.

Ah, again, we are forgetting the tiny and yet significant price difference,
right?

After all, then I could say the same of the Falcon vs the Amiga 4000/040, eh?

|>
|> Personally, I like the Amiga 1200, and may wind up using one myself for
|> video work (still checking to see if it has the one killer app i need to
|> make the purchase worth it)

Check out Scala MM210 (about to be upgraded now to MM300), Real 3D/Imagine/Aladdin 4D,
Image F/X or ADPro.

|> but I don't see how it is so much better than
|> a Falcon as Amiga owners claim.

I don't claim it is leaps and bounds better. Depends on what you want
to do. But putting down the A1200 because of silly nonsense (most certainly

the award goes to Rickard in this category) is a different story.

|> (especially not when it is slower and offers fewer options standard...)

Read above. It carries a much slower price. BTW, did you call Memory World?

|> The only thing it has going for it is the low price, and if that were all
|> that counted, the Amiga 4000/40 wouldn't have a chance against the current
|> (and cheap!) '040 Macs and Centris machines.

True, but the same for the Falcon vs the Macs *AND* the Amiga 4000.

Source record: 21097

then (George Crissman) writes:

Chris Herborth (I think!) wrote:
} >How do you feel about the new AV Macs?
} >They're based on a nice fast chip (68040) and have a nice fast DSP which
} >is probably better than the one in the Falcon (from the specs it looked
} >a bit better; I haven't seen anyone claim either way though).

then (George Crissman) writes:
} Are they compatible with my existing TOS software <grin>?

I doubt they are TOS-compatible, unless they're running MiNT - this
makes them binary compatible to a large extent...

What would be more feasible is the Medusa - an Atari-clone system.
It consists of 68040 clocked at 32MHz, with 8Mb of fast ram. Puts in
about 26Mips, or 4.5 MFlops. Memory bandwidth ranges from 73 to
85Mb/sec - writing is faster than reading (!) Comes with TOS 2
(slightly modified) and in a tower case with 6 expansion slots on
the Medusa bus, (32a/32d lines, 100 pole) and 1 atari expansion slot
(24a/16d lines, 60-odd pole). I'm going to phone for more details,
(not sure about the video/hard disk etc.) but it looks like they
are going to release Medusa bus graphics cards and SCSI2 cards. There
is also a planned 68060 expansion. Who needs Atari when you've got
Medusa ? :-) This thing'll really make MultiTOS fly !!!

Costs about 1400 UK pounds. (That's translated from the Swiss price)

} >Then, maybe, just maybe, people will have brains and STOP USING DOS.
}
} You mean MS-DOS machines, eh? Do you suggest Apple? Atari? Amiga?
} Silicon Graphics? Hewlett Packard? What do you think the next big
} platform is going to be?

No, I think Chris means DOS itself. You can make a reasonable machine
out of a 486/66 (for example) if it's running Linux/Xwindows. Even
a 486/33 puts in an acceptable performance. A friend of mine has a
33 MHz '486 portable, and it runs X great...

[caveat: the MiNT group working on sockets for the MiNT kernel appear
to be doing reasonably well, and that's the only real thing stopping
an implementation of X on the Falcon/ST(e)/TT/Medusa(!!!) Watch
this space - I hesitate to use 'RSN' :-) ]

Simon.

In article <9309271428.AA00714@IBX.COM> zim@IBX.COM (Bill Zimmer) writes:

If you had a Jaguar line which was making money and a Falcon/ST line
which was was losing money (or at best, just breaking even), where would
you spend your money?? Jaguar, of course. Let's make it better. Let's
get even better software, etc.

The Falcon being a niche computer doesn't help. (It's easier to find Atari
products in music stores than computer stores. When Joe Consumer goes to
buy a computer, will he visit a music store or a computer store? Even if
he wants the computer for music/MIDI, the sales droids will steer him
to an IBM or MAC machine. "This is just what you're looking for".)

Competing with the MS-DOG world is like trying to stop an avalanche.
To make the Falcon/ST competitive, Atari must advertise the hell out of
the machine. (Remember how Atari used to advertise in the past? Anyone
remember the Alan Alda TV spots??) They must build a dealer base of
COMPUTER dealers. Not just music stores. Atari's been building up their
dealer network for how many years??

Bill Zimmer - zim@ibx.com

Ahh, but your reasoning has a hole large enough to drive a 1950 Buick
through - you are (incorrectly) assuming that Atari is run by Vulcans,
who operate purley by logic.

As you can see, this is clearly not the case - otherwise they would
have spent more money advertising before, as that is the Logical thing
to do!!

Also, as long as they make a profit on the Atari computer line, why
should they stop? If it pays for itself, why should they stop going?
And indeed, if they are somewhat crazy, then why not funnel some
Jaguar money into the Falcon? Don't forget that the Jaguar is pretty
much at the end of design, so R&D costs will fall (no more etching
test chips for awile). So why not place a bit of that money in the Falcon.

Now Commodore, on the other hand, needs to spend oodles of money still
on R&D to catch up. They just tore some chips and a keyboard off of
an A1200, and called the resulting CD-32 new technology. Perhaps the
CD-64 will be an A4000 minus the keyboard!! Has CD-32 received any
press at all outside of this group? At least the Jaguar I have heard
of elsewhere...

rickard.troedsson@troed.ct.se (Rickard Troedsson) writes:

>Seen the Jaguar Developers list yet? Satisified?

I've seen it alright, and it was pretty disappointing. About five
well-known companies (Ocean, US Gold, Tradewest, Krisalis, Maxis),
a bunch of notorious crap software houses (Silmarils, Anco, Microids
to name a few), and four or five I've never heard of before.

Among the "well-known", Ocean and US Gold are pretty notorious for
producing naff games. Once in a while they release a good title, but
the problem is that they release maybe five substandard titles for
every good title. That leaves two or three *good* companies.

Granted, just because a company isn't well-known doesn't mean that
it won't produce good games. But the probability is higher with
well-known and established companies, who have more resources and
can develop games for several platforms in parallel, effectively
lowering development costs and creating a larger market for each
title.

Another point made in the press release was that the games these
companies were producing would not be released until late spring/
summer 1994.

Even the real Jaguar fanatics in rec.games.video.misc thought
the list was pretty depressing. They had expected more.

Exactly. Despite selling more units, the Amiga doesn't do what I (and some
other people) need a computer for. In my case it is MIDI. Lord knows, after
a day on my new job (programming an app under OS/2 2.1 with multithreading...)
I realize the PC has blown the Amiga and ST completely away. There is no
competition for general purpose or most hobbyist computing.

So the Amiga has more potential for video, and Falcon for MIDI and audio...

All this means is... despite selling pletny of units... it's
not doing much better compared to the "big boys".

>|> And on the issue of speed and crippling, perhaps the whole point is that

"Tiny yet significant"?

So you're saying it is okay to cripple a machine in the name of cheapness?
Hmmmm. :) I should have used that in defense of the Falcon's CPU->RAM
16-bit bus argument...

"It costs less than an A4000/40, which is why we don't need it! Duh!" :)

> After all, then I could say the same of the Falcon vs the Amiga 4000/040, eh?
>

Is it just coincidence, or am I the only one who has noticed when the Falcon
whips the A1200 (which I think is a very nice machine), Amiga owners whip
the A4000/40 out their butts? :) I mean, no one in this discussion even
seems to HAVE one. :)

<at least we have some Falcon owners involved in this... loudly, too...>

<My original figures deleted>

Kendall, thanks for posting those numbers. No flames to you,
you did the proper thing. Now some flames to my 'friend' Rickard:

See that the Falcon ALSO has some problems with a lot of colors?
Looks like the cache didn't help that much.
----------

Well, in all fairness, I think that the slowdown is do to a lot more
memory being moved around by Gemview - I belivee that it uses 4-bit
pixles internally for 16 color mode, vs 8 for 256 color mode - I
believe that would account for the greater time.

----------

52% improvement for first test.
40% improvement for second.

The 'mythical' 100% goes down again :-)

----------

Still, %50 is pretty good!!

----------

I've seen it alright, and it was pretty disappointing. About five
well-known companies (Ocean, US Gold, Tradewest, Krisalis, Maxis),
a bunch of notorious crap software houses (Silmarils, Anco, Microids
to name a few), and four or five I've never heard of before.

Among the "well-known", Ocean and US Gold are pretty notorious for
producing naff games. Once in a while they release a good title, but
the problem is that they release maybe five substandard titles for
every good title. That leaves two or three *good* companies.
summer 1994.

Even the real Jaguar fanatics in rec.games.video.misc thought
the list was pretty depressing. They had expected more.

Hey!! I am one such fanatic, reading that group to the exclusion of
all other earthly activities... You just can't depress a real Jaguar
enthusiast. Sure a few people were depressed, but they seemed
suspiciouslylike the people who didn't much care for the Jag in the
first place... not that I wouldn't mind Mortal Kombat for the Jag, of
course - though I'd prefer a Samurai Shodon port any day!!

It's doing better against ATARI though. Now, since we agree, why you
even consider the A1200? Go for the Falcon and be happy with it. My needs
are different and thus I end with the A1200. Someone that wants a low
cost computer on a tight budget for general purpose, can also go here.

|> >|> And on the issue of speed and crippling, perhaps the whole point is that

|>
|> So you're saying it is okay to cripple a machine in the name of cheapness?
|> Hmmmm. :) I should have used that in defense of the Falcon's CPU->RAM
|> 16-bit bus argument...

No, you can't. The Falcon costs far more than the A1200. If the Falcon
costed less or then you could say that, assuming the Falcon has a way to
expand memory so it can circumvent the problem, which it has. If the Falcon
was within price range of the A1200, it would look better still, but by
the time I buy a Falcon, I can have a hardisk, 6 megs, 50Mhz '030/ 50Mhz 68882 FPU
equiped A1200.

|> "It costs less than an A4000/40, which is why we don't need it! Duh!" :)

Duh!? You are the one who seems not to take into account any price. If that's
it I compare the Falcon against the A4000/040.

|> > After all, then I could say the same of the Falcon vs the Amiga 4000/040, eh?
|>
|> Is it just coincidence, or am I the only one who has noticed when the Falcon
|> whips the A1200 (which I think is a very nice machine), Amiga owners whip
|> the A4000/40 out their butts? :) I mean, no one in this discussion even
|> seems to HAVE one. :)

False. The Team 17 guy has one. And BTW, it is just coincidence, but
when Atarians compare the Falcon vs the A1200 disregarding the price difference,
and Amigans then mention the A4000/040 since if we disregard price we can
compare them, and the A4000/040 whips the Falcon, then the Atarians say 'is it
just coincidence...'?

Flip, don't be silly. It's very very easy to see that a machine that costs
roughly $1000 (US) more than the A1200 can't be just compared without taking
into account that you can expand the A1200 with that price difference. This is
why I brought up the A4000/040. Hey, not only the A4000/0040, but what about
the Cray II supercomputer? DO YOU SEE MY POINT?

No, I don't think 'the Falcon whips' the A1200. Hardwarewise, both
have different niches. Software wise, the A1200 wins.

|>
|> <at least we have some Falcon owners involved in this... loudly, too...>

|> Can you quote me some prices?

Scala- about $300. Image F/X about $180. Image/Alladin - about $279.
Real 3D V2.0 about $379.

Did you call Memory World for the A1200 50Mhz '030 with 4 megs fast ram accelerator?
Or you just don't want to mention it? :-)

|> Also, Mike Van Elst told me about an app called MainActor that coudl be used

Hate to break it to you, but there are probably more clone owners
with DSP sound cards than there are Falcon owners in the whole world.

If a bunch of hackers are rewriting programs to make more use of
the "powerful" dsp, I'd expect to see that same thing happening on
the clone/isa platform.

Though, I'd doubt it, as it's not really all that practical. Just
spring for a faster processor and have ALL your apps run faster.

: >You keep saying the 16Mhz Falcon (with its crippling 16-bit bus) is

: * ********************************************************************
: * "True Color" is adjusting one video primary color (red, green, or *
: * blue) without the requirement to change the hue of the other two. *

Is that you're definition, or the TM definition held by Texas Instruments?
I guess my Trident VGA and any amiga chipset are "true colour" too, provided
you don't use 6bit ham on the ECS and 8bit ham on the AGA chips.

Though, marketing dictates that the Trident is high-colour. AGA can achieve
"True Colour" provided your 256 colours are drawn from the 24 bit palette.

>Earlier, <1993Sep20.160451.22160@btree.uucp>, George Crissman writes:
>> Not in massive quantities ... yet ... and Atari is being cautious
>> because the overall market for computers is depressed, for now.
>> Apple's had to slash prices, IBM's had to lay off workers and
>> experienced an embarrasing decline in stock price from $120/share
>> to $40/share, and Commodore ... well they're still in there trying!
>> This is not the sort of market that encourages a "giant leap forward".
>
>I guessed you missed that bit of market analysis that showed computer
>sales _rising_ over the rest of this year.

The problem isn't selling computers, the problem is in making a profit selling computers. IBM is being crushed by the clone manufacturers. Apple used to sell Macs at a nice profit by selling them at an inflated price. The emergence of Windows and the cut throat clone market cut into Apple's market share. Consequently, Apple cut the price on their Macs to remain somewhat competitive. Commodore is even selling a lot Europe. They're just not able to turn a profit doing it.

(There's a computer super store near me. They're selling machines hand over fist. They sell only clones and Macs. The clone sales are overwhelming compared to the Mac sales.)

If you looked at Atari's latest figures, they're sales are way down. They're just not selling many machines. (Must be their marketing savvy.) In the 2nd quarter last year, Atari had sales of $23.3 million. Atari's sales for the 2nd quarter of this year were only $5.7.

According to the SF Chronicle, "Atari has lost money in six of the last seven quarters and its sales have been falling for years."

They're losing their shirt in the computer market. If the Jaguar takes off, do you think that Atari will throw the money at their ST/Falcon line (which looks like a black hole), or will they invest it in a better Jaguar?

>> My point: Atari is still actively marketing the Falcon.

You're kidding, right? Atari's marketing consists of delivering the computer to the dealer. When they stop saying and start doing then I'll believe them.

Bill Zimmer - zim@ibx.com

Why would I? I respect other people who make good games, and I have no
reason whatsoever to bash other people just to make ourselves somehow look
better. Besides, we're not the only two persons on the net, so it's not
like I could put together a complete pack of lies about these companies
and get away with it without severe flamage.

>See!! so the list really isn't all that bad...

I suppose that depends on what standards you have. It's very possible
that some of the no-name developers may come up with stunning releases.

>It's right that most of the business software for TOS machines comes
>from Germany. However, Atari computers are NOT considered to be business
>machines in Germany, at least not by the public ("Atari? Hasn't that once
>been a videogame company?") is a typical statement.

I stand corrected. I was remembering an advertising brochure from Atari showing a member of the German Supreme Court using a Mega ST to record judicial opinions. Since my information is dated in this regard, and since you are German, you have access to more timely info and are most likely correct.

>You once mentioned a certain benchmark that you saw where the Falcon was much
>faster than the 486/66. It would be fair if you made clear what kind of benchmark
>that was and whether the Falcon's DSP was used or not.

It was in a CeBIT report by Bill Rehbok of Atari, discussing the nearby booth where Digital Equipment (DEC) was introducing their new Alpha computer. DEC was running a 256-color mandelbrot benchmark on three different machines: MacIntosh Quadra (12 seconds), '486 (6 seconds), and the Alpha (5 seconds). 60 feet from that demo, Atari was demonstrating the same benchmark at 4 seconds, much to the chagrin of DEC.

>Everybody knows that the performance of 486/66 is far better than the one of
>the 68030/16.

Unless, of course, the '486/66 system gets beaten during benchmarking by a 68030/16 system.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

George, I don't mean to insult your intelligence , but have you ever been to Germany? In my experience... I work at a place that has a high volume of tourists from Germany (which we will assume to be working class or higher individuals) and I have asked them if Atari is a big force in Germany.

It is not. Plain and simple.

This whole thread of the falcon is better than a 486 and Atari is the best machine out there is crap!
I own an Atari... a TT to be precise. I like it. I know it's limitations. I know that Atari will never be IBM. I know that the only way Atari is going to survive in the mid-future is if the Jaguar sell (which I believe it will)

>and that's where a lot of the business software
comes from. ("Big
>deal," he says.) Atari is not marketing their computer as a business

Ricardo, you seem very acidic in your remarks. Don't let your flame-fest
with Rickard carry over into our discussion. Geez.

Someone that wants a low cost (powerful) computer on a budget may be equally
happy with either platform for general purpose work. There exists strong
areas on both that non-niche users may find useful. Heck, Atari STs still
have a strong DTP lineage with Calamus still in the product lineup....

No, what I am saying is that your defense in the flaws of the A1200 is that
it costs about $500 less for a base A1200 w/2MB and 65/80 MB HD. A Falcon
4/80 costs about $600 less than a base A4000/30 ($1799 around here as far as
I know, from pricing Software Advantage (Rockville, MD) and Buried Treasure
(same location).

Heck, we keep adding $600 a pop to what we dream about and we can eventually
buy a NeXTStep/486 box. :)

>just coincidence...'?
>

Only happened once. :) and *I* did it. :)

Ok, the Team 17 guy has one. But he's a developer. Developers tend to have
the fastest thing they can get for their compiles. :)

I've seen a few A4000 owners (not sure who is 030 and who is 040) floating
around in the Internet, even a few in America, but none in this thread.

> Flip, don't be silly. It's very very easy to see that a machine that costs
>roughly $1000 (US) more than the A1200 can't be just compared without taking

>why I brought up the A4000/040. Hey, not only the A4000/0040, but what about
>the Cray II supercomputer? DO YOU SEE MY POINT?
>

Yeah, I see your point. But what you're forgetting is that even if you have
a 50mhz 68030 and 6MB of RAM, that A1200 still can't run Cubase or Calamus or
any number of applications that someone who has an ST might want to run.

Or for that matter, for the lack of some areas of software, a user would
pick a Falcon over an A1200, or vice versa.

Surely for video work, the choice is easy... an A1200. No problem there,
unless the person has mental problems. :)

So be reasonable.. for audio and MIDI, the ST line is the choice.

For general purpose computing, I'd say that neither machines holds a vast
advantage based on the quality of its software... why? Because I do not
see either platform's non-niche products being publicized in the trade
magazines or used professionally.

(i.e., we don't see write-ups in Computer Shopper comparing how useful an
A1200 or Falcon is to a PC when they do "best buys under $1500" do you?)

> No, I don't think 'the Falcon whips' the A1200. Hardwarewise, both
>have different niches. Software wise, the A1200 wins.
>

I agree for the total number of packages available. In some areas, the
Amiga holds a distinct advantage (video), and in some they are about
equal (WP, for example, and compilers), and in some the Falcon/ST are
better (music, audio, MIDI).

Timeout from FlameFest. :)

Can you post me (better yet, EMAIL) the specs on what these packages can do?
My #1 purpose here is to be able to set specific events to occur in an
animation with accuracy down to about 1/30th of a second. This way I
can listen to a song and create a "hit list" of times when things should
happen in the animation, and then have the animation I create be synced
to the music in that respect.

>
> ST's suck in general. Get a Falcon if you like the 'ST's.'

Geez. If I were really pissy I could say Amigas suck even worse, but what do we accomplish with such general statements?

And let me just say this... I've done a LOT with a "sucking" Mega ST 4 so I would say that it isn't the computer, but the user that determines if it sucks.

I've seen morons do less with a 486/66 than I do on a 16mhz 68000.

The Amiga is a nice computer that used to have a cutting edge chipset, but now the PC world has caught up (so have the Macs), and Atari has caught up to them too... in some ways, Atari is backward (16-bit CPU->data bus in base model) but Commodore is not flawless (using a 68EC020 when they could have had a "turbo charged" system with a full '030 to really make the 1200 scream).

Source record: 21130

I had an experience which would make any Atarian's heart bubble over...
Some friends of mine brought over some of their software to play with
on a 486 which has been sitting next to my Atari for a month.
I have been able to do lots of comparisons between game programs/graphics/
disk loading etc... between the 2 machines. My friends were BLOWN AWAY
by the games I have been showing them... They find it hard to believe that
this crummy-beat up-looking Atari can out-perform this high-powered 486
machine.... Now, if I went out and got a sound-blaster for the 486 and
went out and paid $80 for 1992 - present games, I guess the 486 would
be a lot better, but you still can buy games for STs at reasonable
prices - just got MIG-29 for $28..... What a joke - a 9 year old
machine can keep up with the business world's current monstrosity.
Kind of makes you want to scream!!!! :---O

----- Mike

This is not a benchmark. it was a contrived situation - a fractal program which on the Falcon had been coded to use the DSP.

|> >Everybody knows that the performance of 486/66 is far better than the one of

Much as I love my Falcon, it's simply not open to debate that a 486/66 is faster or not. A 486/66 is much more powerful than a 68030/16. Period. Sure, the DSP can be used in tandam to good effect but in brute processing power, it's no contest. Anyone that cares to argue otherwise is doing themself and the Atari community a diservice.

> OK. Now tell me why it is slower than a 16MHz A3000 ? On second thought,
>don't bother. I know the answer already.

That sounds really wierd. I did a simple benchmark between a 25MHz A3000 and
a TT, the TT was faster. (This was when the A3000 first came).

I want to clarify how the databus on the TT works. The CPU resides on a
33 MHz and 32 bits wide databus. The TT-RAM is connected to that bus so it's
also 32 bits wide and supports burst-mode. The ST-RAM is 64 bits wide and
the bus-speed is 16 MHz. The data that is read and written to/from the ST-RAM
is multplixed to 64/32 bits depending on the datadirection.

I can't say whether there are any contention reading/writing to the ST-RAM and
if burst-mode is available on it. (I doubt it)

If you ran the same benchmark on a 16 MHz A3000 with fastram and a TT with
TT-RAM, and the benchmark only used the fastram/TT-RAM the TT should be twice
as fast.

[stuff deleted]

Whether the TT is badly designed or not I don't care, since in raw processing
power it outperforms any standard A3000.

Personally I think it's a bit silly to compare computers, since you always
can find a better, bigger and faster computer to compare with. :)

[ Many excellent points about computer superstores and Atari's
finance regretfully deleted to save bandwidth. ]

>>> My point: Atari is still actively marketing the Falcon.
>
>You're kidding, right? Atari's marketing consists of delivering the
>computer to the dealer. When they stop saying and start doing then
>I'll believe them.

They've generated press hype for the Jaguar. They've had the Atari
booth at well-known computer shows such as CeBIT, and at lesser-known
shows such as the San Diego Computer Fair. They've even been showing
up at user-group festivals such as the Glendale show, held not too
long ago.

Deliveries of the product to the dealer is just one part of marketing.
Advertising and creating the desire to purchase is the other part of
marketing. Attending the shows is advertising. Running commercials on
television (planned for the Jaguar for the Christmas selling season,
I think) is advertising.

Although their finances may make their marketing less than overwhelming
:-), they *are* marketing their products.

> > To musicians, probably yes. To everyone else, no.
>
>And to hobbyist and computer hackers who couldn't care less about who's
>dominating the corporate business world. I choose a Falcon simply because it's
>more fun than the average boring clone running Winslows. As long as Atari
>continue to produce computers that are actually fun to use, they will remain
>competitive with people like myself.

Yes, the Falcon may be more fun and hobbyists and hackers may prefer it
over the MS-DOG computers. However, that doesn't necessarily mean that
Atari will ever turn a profit on their computer line.

Customers vote with their dollars. Atari has lost money in six of the
last seven quarters and its sales have been falling for years.

If Atari doesn't penetrate beyond the hobbyist/hacker market, they won't
survive as a computer company. Atari's sales have slumped to $5.7 million
in its 2nd quarter versus sales of $23.3 in the 2nd quarter of last year.

Bill Zimmer - zim@ibx.com

Is the DSP in the sound card only usable for sound? (Just
wondering....)

>If a bunch of hackers are rewriting programs to make more use of
>the "powerful" dsp, I'd expect to see that same thing happening on
>the clone/isa platform.

Registered Atari developers will probably be adding support for the
new hardware in future upgrades to their existing software. You
probably won't see as much of that on the MS-DOS machines because
the DSP isn't a standard-on-the-motherboard part.

>Though, I'd doubt it, as it's not really all that practical. Just
>spring for a faster processor and have ALL your apps run faster.

Faster processors are expen$ive. Sure, it would be nice, but the
cost of the upgrade (faster processor, faster memory, faster glue
chips, faster everything else) would be prohibitive.

>I'd be interested if there is going to be a *next* Falcon. I've heard
>of C='s plans for the future publically stated. You may or may not
>believe that they can pull it off, but I'd prefer someone making
>the right noises instead of deafening silence.

The second-hand rumor I read in ComputorEdge is that a Falcon/040 is
under development. It's supposed to have a detachable keyboard and
live in a jet-black case. That's all I've heard.

>: * ********************************************************************

I quizzed Keith Jack, author of "Video Demystified -- A Handbook for the
Digital Engineer" (available at technical bookstores for US$29.95 list)
(shameless plug) about the concept. He expressly stated that the number
of bits is not a factor in the "True Color" concept.

>
>Just out of curiosity, why did Lattice drop their Amiga C compiler but
>go ahead with a C++ compiler? Seems odd....

The above is somewhat mixed and matched: SAS bought out Lattice
and hence Lattice C became SAS/C. Lattice C++ is an old product
that fizzled and is no longer available. SAS is claiming a C++
for some years now with a release this month. Comeau C++ 3.0 With Templates
is available for the Amiga for some time now and although long in beta
for the Atari, not officially released yet.

Whoa! Since when was it proven the TT was slower than a 16mhz A3000?

I've seen both in person.... used both... and to my perception, the TT is noticably faster. There other considerations, other than CPU-type in that perception such as the OSes, and what I was doing on them...

ST's suck in general? Now that's an intelligent, substantiated quote if I ever heard one. We could say the same thing about Amigas, contempibles, Macs, whatever - It's just a badly opinionated claim, and I think that if you are getting fed up with the discussion, i.e. having too revert to DUMB remarks like that, then move on. We're trying to have a discussion here :*) ...

Karl

BTW That second line WAS SARCASM.....

Especially one with very old rumours. The FIRST TT's had in fact 16Mhz which
was too slow and was very quicky corrected by Atari.

Here is my Falcon performance test:
The MODplayer PAULA.ACC with interpolation on and 50Khz uses 50% cpu time on
the TT, it uses 100% on the Falcon. Of course it is highly cache optimized.

This is wrong... I remember reading ATARI specs that the TT also had a problem with memory, it isn't pure burst-mode-32 bit access...

I don't remember what was it, can someone with those specs want to comment?

(Not you)

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
|> happy with either platform for general purpose work. There exists strong
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
/
I hope here you are comparing the ST vs the A500 in the old days. If you
are comparing an ST vs an A1200 you must be surely joking.

|> areas on both that non-niche users may find useful. Heck, Atari STs still
|> have a strong DTP lineage with Calamus still in the product lineup....

Ah, here I beg to differ. The ST's are good for MIDI, I admit. DTP?
Go with Amiga. The Amiga has more illustration type programs and desktop publishing +
Image Processing tools of quality. Remember PageStream? They jumped ship to the
Amiga and made that version their 'flagship version' because of how ATARI was
selling/marketting
their ST's.

For general purpose software, the Amiga has more variety and powerfull software
than an ST. (WordProcessing *MIGHT* be an exception).

Now, while I don't want to be acidic Flip, if this sounds acidic, well, too bad.
When I bought my first A500, I was considering jumping to an ATARI ST. I had an
ATARI 600xl and 130XE before, and I liked ATARI more than Commodore.

So what happened?

The ST was great when it came out- price/peformance wise. But when the Amiga 500
came out it
pretty
matched the ST price and it was *obvious* to me what computer hardwase wise was
superior.

Software-wise the ST started to lose support and the Amiga gained it. C= came out
with new OS versions. Atari made promises but didn't deliver. I remember the ST-cdROM.
How much time way before the competition, yet it never came out.

I chose Amiga and I don't regret it. Taking out my personal
video/multimedia needs, even general/purpose wise I prefer the Amiga.

Now if you are into music, ok, go for the ST (or for the Falcon nowadays).

|> >|> "It costs less than an A4000/40, which is why we don't need it! Duh!" :)
|> >
|> > Duh!? You are the one who seems not to take into account any price. If that's

|> 4/80 costs about $600 less than a base A4000/30 ($1799 around here as far as
|> I know, from pricing Software Advantage (Rockville, MD) and Buried Treasure
|> (same location).

I know that Flip, wich is why I don't compare the Falcon against the A4000.
The only reason I brought up the A4000 is because you don't seem to care that
the A1200 cost less, and I dare to compare the A1200 against the Falcon
because: 1. people do it here anyway, 2. I can put up a very competitive system
(that is actually way faster than a Falcon
in the majority of applications) for the
same price.

Since people here don't mind the price difference of the A1200 vs the Falcon,
and yet dare to compare them, I dare to compare both spending the same amount
of money.

|> Heck, we keep adding $600 a pop to what we dream about and we can eventually
|> buy a NeXTStep/486 box. :)

No, you should read above.

|> >|> Is it just coincidence, or am I the only one who has noticed when the Falcon

|>
|> I've seen a few A4000 owners (not sure who is 030 and who is 040) floating
|> around in the Internet, even a few in America, but none in this thread.

Probably because they don't care. People are comparing also against the A1200
and not vs the A4000. If you do that, they might laugh.

|> > Flip, don't be silly. It's very very easy to see that a machine that costs

|> >
|>
|>
|> Yeah, I see your point. But what you're forgetting is that even if you have
|> a 50mhz 68030 and 6MB of RAM, that A1200 still can't run Cubase or Calamus or
|> any number of applications that someone who has an ST might want to run.

Don't bring Calamus, thank you very little! If you think that the Amiga
doesn't have *EXCELLENT* desktop publishers, well, I welcome you to reality.

The latest version of PageStream is put right against QuarkXpress on the Mac.
(I would still expect somehow Quark Xpress to win). About Cubase- ok, music
applications are better on the ST, true.

About the 'number of applications that someone who has an ST might want
to run'-> well: 1. Those that want to stick to the ST and ATARI, well
go and buy the Falcon and be happy.

2. New buyers, given to chose between a Falcon an an A1200
with 50Mhz 030, I guess should go for the A1200 (and I think
that's kind of what they are doing- going for the A1200)
unless you have a compelling need to run this particular
music application that only runs on ATARIs.

No Flip, I don't disagree with you in what you said. If you put it in that
context, well an ST person has to weight going this way or staying this way.

NOW, FOR A NEW COMPUTER BUYER, the situation is different.

For general purpose most likely they'll end up with a clone....

|> Or for that matter, for the lack of some areas of software, a user would

|>
|>
|> Geez. If I were really pissy I could say Amigas suck even worse, but what
|> do we accomplish with such general statements?

OK, sorry for that. I guess I was looking at it from a general purpose
point of view. Today I wouldn't recommend an ST except to my worst enemies
considering you can get an A1200.

|> And let me just say this... I've done a LOT with a "sucking" Mega ST 4
|> so I would say that it isn't the computer, but the user that determines if
|> it sucks.

True, but there's a limit or 'ease of accomplishing things' depending
on the computer you got.

If not, well, that B/W Mac Plus could do everything I do today right?

|>
|> I've seen morons do less with a 486/66 than I do on a 16mhz 68000.

Yep, and viceversa.

|>
|> The Amiga is a nice computer that used to have a cutting edge chipset, but
|> now the PC world has caught up (so have the Macs), and Atari has caught up
|> to them too...

Atari hasn't caught up to them. The only chipset I see ATARI truly caught up
to them and surpassed them is the one in the Jaguar, if it can do what it
supposedly can. Kuddos to Atari for that one, hope they don't screw it up.

|> in some ways, Atari is backward (16-bit CPU->data bus in
|> base model)

talk about making a limitation a feature!

but Commodore is not flawless (using a 68EC020 when they could
|> have had a "turbo charged" system with a full '030 to really make the 1200
|> scream).

It all depends. Commodore asked developers for the Amiga what they wanted:
More memory, better CPU, etc. Developers said what they wanted.

The 68EC020 allows the machine to perform very well and it is low cost.
After all, I would prefer that with a 32-bit datapath instead of a crippled '030 design.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Aaah, there we finally are, THAT was my question ... the DSP may be something very nice to have in a computer, especially when software benefits from its capabilities. Now imagine, every new software product for Atari computers uses the DSP extensively; not only in typical applications as real-time sound processing. Falcon users jump up and shout: "YEAH! Wonderful!", of course.

In order to get the program running on an older ST/STE/TT, it would have to be rewritten and adapted to these machines that do not have a DSP.
Although I doubt it, let's suppose it's as easy as to adapt code for machines with or without a math coprocessor: Just different libraries are used (although this may not be very efficient).

But the problem is, that currently there is no possibility for ST/STE/TT users to upgrade their machines with DSPs -- FPUs can be added easily, in the TT it even is standard. Faster CPUs are also available: from a 68K with up to 36 MHz to a 68040 board with FAST RAM ( <- although this one is overpriced). Ok, the TT is not upgradeable.

So I think it was just frustrating for users of the older machines if they wouldn't be able to upgrade their machines in order to get the new programs running at the same speed or even get them running at all.
So the only alternative is to buy a Falcon, what I never did, because my TT is a far better machine to do serious WORK with: 1280x960 mono at 72 Hz, stunning sharp and quick, 68030/32, 68882/32, FAST RAM.

And if there ever comes a DSP board (believe me, I'd appreciate that if it was reasonably priced), where will it be placed? In the MEGA slot? In the VME slot? And if there already is a graphics card placed in it? ... there we are again, the old upgrading problem with Atari computers ... it's so frustrating.

Chris.

> others. Atarians can select from several word processors,
> several spreadsheets, several communications programs, etc.

Yes, usually only *one* software package per application type is usually
needed by the average computer user. However, because of the immense
size of the MS-DOG market, they have a lot more packages to choose from
and at many different price ranges. Also, a smaller percentage of
customers is needed by MS-DOG companies to make their software
profitable. A 10% market share in the clone market gives a company
more profit potential than 60% of the Atari market. How many
companies have abandoned the Atari market altogether or have gone
out of business because of the smallness of the Atari market.

Even game companies have abandoned the Atari platform.

>B) Have you ever tried to actually *purchase* some of this
> massive software base? Waltz right in to your local

> Borland C compiler instead?" A massive software base is of
> exactly zero benefit if you can't acquire it!

Some stores are the pits. Not necessarily because of the size of the
clone's software base, but because they just don't want to go that
extra mile for the customer. My suggestion would be to have them
watch a few Tom Peters lectures. Excellent customer service is
out their and for all platforms.

(There are also zillions of mail order companies. Have you checked
out the size of Computer Shopper lately??)

>C) As soon as alternate software choices are discussed, someone
> somewhere always blurts out that "if it's not Microsoft
> Word and Microsoft Excel it's no good and I won't use it."
> So why bother having a large base of software, anyway?

Some people are just like that. Not everyone uses Microsoft products.
They do know how to market the hell out of a product, though.
Microsoft's advantage is that they have an agreement with most clone
manufacturers to bundle their products with the computer. If Joe Consumer
buys a clone, MS-DOG, Windows, etc. are usually already installed.
Some stores will install OS/2 if requested. (However, the clone maker
must still pay Microsoft their tithe even though MS-DOS (etc) isn't
installed on the machine).

Also, your answer reminds me of this newsgroup. Atari vs. The World.
(The World is winning, by the way). (E.g., "If it's not Atari, it's
no good and I won't use it.") If you're not a musician, there are mighty
few reasons to get an Atari.

Atari's sales slumped to $5.7 million in the second quarter. Compare
this to Apple's sales and the sales by the various clone manufacturers.

>D) The cost of the software is incredible! For the MS-DOS

> a hard drive and memory to a 1/0 Falcon), the upgrade to
> MultiTOS will only cost half as much, at the most.

Agreed! This is usually the case because of the many business who have
clones and purchase software. Some people swear by Word Perfect.
Some people swear at it. (I'm in the latter category.)

Some companies, however, equate price with quality and number of features.
(Reminds me of a company in the Apple market many years ago that actually
saw a sales increase with the RAISED prices. People thought that a
software package at that low a price had to have something wrong with
it. If price alone ruled the market, Atari (and Commodore) would have
more sales. Unfortunately, marketing affects sales more than price.

>E) Have you ever tried the software manufacturer's support
> service? In the MS-DOS world, you wait forever, and in

> you don't get service *this* good in the world of clones!
> And naturally, I recommend STalk The Market to anyone who
> trades in the stock market because of the great support!

The more complex the software product, the greater the cost of
support. The cost of support usually isn't included in the cost of
the product. Rather than have the cost of support included in the
cost of the product, it's fairer that those that need the support
have to pay for it. One reason that you may have had such good
support might be that the Atari market is so small. What would be

easier to support, an Atari product that sells (at most) a few thousand copies or clone product that sells many thousands of copies?

Support people that CARE are what counts.

Of course, Atari has a 1-800 number for support. After all, you paid for the hardware, right? Shouldn't that come with some free support?

Oh, and if you purchase Atari software, they have toll-free support, right?

>Here's my guess: Atari, because there's an application for each
>major software activity (word processing, spread sheet, data base,
>telecommunications), and because Atari software is cheaper than
>the MS-DOS equivalents.

How can anyone call Atari competitive? Maybe in MIDI applications. That's about it, however. Jane/Joe Public vote with their dollars. Are they buying clones or Ataris? When you count the coputer ads in your local paper's business section, are there more Atari ads than those for Apple or the clones? Of the ten closest computer dealers nearest you, how many stock Atari, Apple, clones? Pick up a recent issue of Computer Shopper. Count the Atari ads. (Even when they had an Atari section, Atari ads were few and far between.) Go to a newsstand and count the number of computer magazines. How many are for the Atari? How many are for the clones? Are there computers where you work? If so, how many are Atari? Just because you might think that Atari has the better hardware, that doesn't drive the market unless there's something that'll run on it. Do you think that a business is going to purchase Atari STs because they have a MIDI port while clones don't? Will companies purchase a Falcon because it has a DSP port but the clones do not. Most companies have a large investment in software. Buying hardware that won't run the existing software would result in an instant pink slip. Can I get Word Perfect for the Atari? Wonder why they stopped supporting the Atari line?

The Amiga had superior hardware compared to the clones and the MacIntosh when it was released. (It took Atari how long to get a blitter?? It took the Atari line how long to get pre-emptive multi-tasking?) However, Commodore marketed their machines just as well as Atari marketed theirs. The end result is that both Atari and Commodore are distant also rans. The Amiga has a niche in the video market. The Atari has a niche in the MIDI market. That's it. They didn't market their hardware correctly. They're in the dust. The Falcon will not save Atari.

So what if Atari software is cheaper? It's targeted at the ST/Falcon owner not to the clone owner. Atari 8-bit software is even cheaper than ST/Falcon software. Therefore, using your reasoning, Atari's 8-bit computers are more competitive.

How'd I do? :-)

If you'd take your Atari blinders off and visit the real world.....
There's a tremendous computer market out there and Atari is almost
nowhere to be found. Total PC sales should INCREASE this year compared
to last year. Meanwhile, Atari's sales slump. Atari should've
positioned the ST as a game machine. However, they tried to position
it as a business machine and lost.

>>PCs rule not because their hardware is better than Mac/Amiga/Atari,
>>but because
>>
>>(a) IBM licensed the technology so that clones could appear (resulting
>>in a price war feeding frenzy),

>IBM didn't license the technology until after the clones had
>forced their withdrawal from the market. (Someone at IBM probably
>said, "Hey, they beat us up by using our own architecture! Let's
>sue 'em for licensing fees. That'll show 'em, uh-huh.")

But, IBM did license the technology. Meanwhile, Atari won't even license
their 8-bit technology. GEM could've caught on if it had been marketed
correctly.

>The clones appeared because IBM was overcharging for the PC/XT/AT,
>and because there was nothing proprietary in the hardware (i.e.,
>it was 'easy' to do). It was market forces in action (hooray!),

Same was true for Apple. It's only recently that they've lowered their
prices. (They were losing market share unless they became more
competitive price-wise, it would drop even further because of the
increased sales of Windows.)

>>(b) Business trusts the IBM name (it didn't hurt that many businesses
>>were already using IBM mainframes),
>

>machine (although it can be used for business) in the United States --
>they're marketing it as a home computer. Different market, different
>needs.

Dismal sales. The word from some recent postings is that Atari is
now losing market share in Germany. There goes your one stronghold.

Most home computer users purchase machines that are compatible with
what's at the office. (Just like when Apple years ago used to control
the education market. Many parents bought an Apple II for their
children because that's the computer that was at school.)

>>(f) The combined marketing clout of IBM and Microsoft and the low low
>>prices from the price wars between the clone manufactures is an unbeatable

>>>[...] The MS-DOS machines appear to be the ones that are 'not competitive'.

We differ on this. Atari doesn't have the software that I want to run.
Even if they did, I would be very hesitant to buy Atari hardware knowing
that they might leave the computer market. (Pity those people who bought
the XE game machines, and 2600s, and 7800s, and whatever else).

Do I need a DSP for my spreadsheet? Or my database? Or my word processor?

>One drawback of the price wars is that 'cheaper' parts are being used
>that are more likely to fail. If you upgrade everything in your system
>every two years or so, you won't notice the decline in quality. But if
>you keep your system for awhile, things will start going wrong. My ST
>is 7 years old, and has never been in the shop for repair (not counting
>a memory upgrade and a TOS upgrade to 1.4).

Do you have any proof of this??

Maybe they're cheaper because of economies of scale and not because they're
more likely to fail. Just because something is inexpensive doesn't mean
that it is more likely to fail. (Since software for the ST/Falcon is
cheaper than the equivalent software for the clones, then the ST/Falcon
software is more apt to be bug-ridden and more prone to failure.)

>>> [...] My point: Atari is still actively marketing the Falcon.
>>
>>Actively?? Marketing it where??
>
>Just recently, right here in San Diego and Glendale: once to a general

>

>It's true that the advertising needs to be increased. And it's true
>that Atari machines need to be stocked at computer marketing chains
>in addition to the existing network of Atari dealers. The limiting
>factors are time and money -- but Atari is addressing the need.

Atari's been "working" on this for a number of years. It's only getting
worse, not better. If we'd get as much marketing out of Atari as we
get hot air.....

>>Of course, the Falcon runs tons of business (yes, BUSINESS) software.
>>How can the Falcon/ST line help my company? It can't.
>
>Pick up the International TOS Software Catalog ($12.00 at your Atari
>dealer, or direct from Atari) and select the software you need. You'll
>find a healthy section devoted to business applications (yes, BUSINESS).

Until Atari get's their machines in mainstream computer stores, they're
not going anywhere but down, down, d
o
w
n.

One shouldn't have to contact Atari to get a software list. The software
should be at the computer store. One should be able to find an Atari
dealer without having to pass 10-20 computer stores that don't sell Atari
products. As it is today, one really has to work to find an Atari
dealer. Unless one orders by mail, it's hard to find anything for the
machine.

To make matters worse, most Falcons are being purchased by ST owners.
Atari isn't increasing their customer base. They need to convert people
from other platforms to dump their Mac/clone and get a Falcon. Consequently,
the Falcon market will be even smaller than the ST market.

>It is not. Plain and simple.

There was another posting from Germany with the same point. I was relying on an Atari brochure when I made that point, but I've already retracted the statement. I'll do so again, if you wish.

>This whole thread of the falcon is better than a 486 and Atari is the best
>machine out there is crap!

I thought we were discussing the cost/performance ratio! (It does say 'Atari vs the EXPENSIVE World of DOS' in the Subject: line, doesn't it?).

>I own an Atari... a TT to be precise. I like it. I know it's limitations.
>I know that Atari will never be IBM.

I dunno about that. IBM has experienced it's first-ever round of layoffs, the stock price is down to $40.00/share from $120.00/share, various divisions are being spun off into their own little companies, and IBM-branded machines have a diminutive market share (in the PC market, anyway). The way things are going, maybe Atari *will* be IBM -- it's just that Atari got there first! :-)

>>Marketing does make the difference, you're right! But I disagree on

>how a 1500 falcon will beat it!!

I'm referring to the results of the 256-color mandelbrot benchmark, shown by Digital Equipment Corporation at CeBIT in Germany, and reported by Bill Rehbok of Atari. DEC was showing their new Alpha computer, and comparing it to other machines. The benchmark times were: Mac Quadra: 12 seconds; '486 @ 66 MHz: 6 seconds; DEC Alpha: 5 seconds. Sixty feet away, Atari was showing the same benchmark in 4 seconds. "DEC was not pleased to be upstaged by a home computer," noted Bill Rehbok.

Well, try to run Windows 3.1 on a original IBM PC.. same problem... :)
Every type of computer has this problem more or less. New programs take advantage of new features in the computers. Otherwise there wouldn't be any progress, would there?

Btw, I can't see why you would expand a ST/STE/MSTE or TT with a DSP since the DSP in the Falcon is often used in conjunction with the new soundsubssystem. And if you add a DSP to an older Atari you would get compatibility problems.

Maybe Atari is doing what Husqvarna is doing as far as business
operations is concerned. Most people (well, in San Diego, anyway) think
of 'Husky' as a motorcycle manufacturer, yet it's only a small sideline
of their main business of making sewing machines.

That might be Atari's plan: use their well-known expertise in video
gaming (the Jaguar -- soon!) as the big money-maker, and dabble in
the leading edge of computers.

Just a thought....

I referred to the upgradability of Atari computers and to the problem
that often there just isn't enough space left in the case to place additional
hardware in it, which is no problem at all with almost every PC clone.

The upgradability of every PC is far better than of every Atari computer.
If you want more computation power, you can simply replace the CPU or the
motherboard ( <- !)and KEEP the case, the power supply, the FDDs etc.
without a problem.
The problem with Atari computers also is the fact that it can lead to
overheating problems with the small cases when you add some extension.
Or power supply problems when you e.g. add a 16 MHz board and a graphics
card in a MEGA-4 -- I had to deal with exactly that problem.

|> Btw, I can't see why you would expand a ST/STE/MSTE or TT with a DSP since the DSP in
the
|> Falcon is often used in conjunction with the new soundsubssystem. And if you add a DSP
|> to an older Atari you would get compatibility problems.

You're right, the DSP is often used to manipulate a sound signal, digitalized
before by the new 16-Bit A/D converters. But if audio signal processing is seen
as _the_ main application for the DSP, you don't have to buy a Falcon. Just add
a 16-Bit soundcard with a DSP to your PC, including software.

But the DSP also has the potential to generally increase the computation power
of the system -- IF there is software that uses this coprocessor, like e.g.
the Mandelbrot program shown on the CeBit, although this is an application
which isn't very useful, just nice to watch, nothing else.
Compression/decompression programs are far more useful and could also benefit
a lot from the DSP. So it does make sense to have a DSP but not a sound sub-
system in a computer.

Chris.

You're probably wrong on that one.. the TT originally had a 16mhz 68030 but
the system was upgraded to a 32mhz 68030 running off a 16mhz motherboard.
However, ST-RAM was rigged up in such a way that it could still do full
32-bit access to it.

> I don't remember what was it, can someone with those specs want to comment?
>

Well, I can check but I'm sure a TT owner has probably already mentioned it.

Did they really? I've heard two different stories about PageStream:

1) they indeed jumped because of larger market on the Amiga.
2) they got whipped by another application in the Atari market (Calamus).

I won't say #1 is impossible, but if going to a larger market was their
mission, why not port to the PC/Windows platform?
I also would think that in DTP if the best you can offer is PageStream 3.0,
you might find the ST is still ahead, witness Calamus SL.

>
> For general purpose software, the Amiga has more variety and powerfull software

What areas are we talking about here, in terms of "general purpose" s/w?
How much do these application cost? One thing to remember is that stuff
like Atari Works comes standard on all HD-equipped Falcons. SpeedoGDOS
and MultiTOS are also bundled.

As far as seperate commercial products, if you can name some specific areas
(other than video games, an area the Amiga has dominated...) I probably could
find comparable products fro the Atari.

> Probably because they don't care. People are comparing also against the A1200

Which means both platforms we're advocating LOSE.

:( :( :( :(

>

Just out of curiosity, since we're discussing computer purcahses in terms
of "general purpose software", what software are we talking about that the
Amiga would have that is superior to the Atari's in that given area?

(i'm asking this partially as a programmer who'd love a good challenge :) )

Of course if said program was properly written to take advantage
of the Falcon's SDMA sound coprocessor, it would take NO cpu time.

Just like the Amiga, the Falcon would be nothing special w/o
utilizing the custom chips.

Ok. Seems all the techies have come over here to .advocacy, so here's a simple one - is the Falcon SCSI II fast or fast and wide - what difference does it make you say? In my books - a lot. Firstly, the speed of fast and wide is much faster than plain fast, and secondly, the price - f+w is about 2x the price of fast ...

Karl.

Short answer: Because PageStream, before version 3.0, was entirely
written in assembly language, and changing from one OS to another was
probably easier than doing a total rewrite.

: As far as seperate commercial products, if you can name some specific areas
: (other than video games, an area the Amiga has dominated...) I probably could
: find comparable products fro the Atari.

Aside from the video market, you're probably right.

: Just out of curiosity, since we're discussing computer purcahses in terms
: of "general purpose software", what software are we talking about that the
: Amiga would have that is superior to the Atari's in that given area?

Any kind of multimedia or presentation use; any "desktop video" uses.

Graphics design of any kind, including CAD, rendering/modelling,
paint/draw.

Professional video editing. I'd venture to say professional audio as
well, through something like Studio16's setup.

And, of course, emulating a Mac. ;)

That is NOT wrong! TT -> TT-Ram supports full 32bit access, including
burstmode.

Just ran a complete RAM benchmark on my Falcon, comparing my normal 16Mhz
Falcon030 to a 32Mhz TT030 with TT-Ram.

Turned out that Falcon RAM-fetch was 61% the speed of TT RAM-fetch.

Program used: GEMBench

Of course, the 16bit 50Khz modplayer for falcon uses 8% CPU time because
evrything is done by the DSP.

It's not wide (i.e. it has 8 bit path) , if it is fast.. i don't know

But it works fine.

Well, not all Atari machines that aren't Falcons are 8 years old.
What about one, two or three year old STEs or TTs?

|> CO> But the problem is, that currently there is no possibility for ST/STE/TT
|> CO> users to
|> CO> upgrade their machines with DSPs -- FPUs can be added easily, in the TT it
|>
|> Like the A1200 then ..

The fact that the A1200 isn't upgradeable with a DSP doesn't make
it better for the Atari models that aren't Falcons.

|> CO> So the only alternative is to buy a Falcon, what I never did, because my
|> CO> TT is a

How? Perhaps with Screenblaster? Oh yes, 1280*960 at 87 Hz interlaced.
This results in a real horizontal frequency of 43.5 Hz and is simply
ridiculous. Nobody can work for more than 20 minutes in that mode,
except when he/she has fun in torturing the eyes.

|> I agree that the 68030 is an upgrade, the
|> 68882 is no biggie though, there's a slot, all you need is to buy one ...

In the TT the FPU is standard and you don't have to pay anything extra for that.

|> FAST RAM is also available from several 3:d party suppliers ..

The later series of the TT don't need an extra FAST RAM board.
It's also standard and again you don't have to pay for it.

|> What you gain? Can you say SOUND&GRAPHICS very fast? :-)

CPU speed, FPU, FAST RAM, much higher resolution with a sharp
and absolutely flickerfree picture. Everything without extra
costs.

|> CO> the old upgrading problem with Atari computers ... it's so frustrating.

|>

Ok, of course there also are problems in the PC world when it comes to
upgrading a machine. But generally, it's much easier and also cheaper.
Nobody can deny that.

Chris.

Well, PageStream jumped ship BEFORE Calamus came out. So #2 is wrong.

|> I won't say #1 is impossible, but if going to a larger market was their
|> mission, why not port to the PC/Windows platform?

Probably at their version state they would have a hardtime vs other
Mac/PC programs, particularly the Mac, which has been the Queen Computer
of Desktop Publishing.

|> I also would think that in DTP if the best you can offer is PageStream 3.0,
|> you might find the ST is still ahead, witness Calamus SL.

I won't comment since I haven't checked it out. But from different
friends that work with DTP businesses they have heard the Mac, the PC,
rarely the Amiga and nothing about the ST. I'll check out Calamus SL
for the sake of fairness.

Where can I check out Calamus? Any brochure/add somewhere?

|> > For general purpose software, the Amiga has more variety and powerfull software

Is it really? Weren't people complaining that it wasn't finished yet?
Also the mere fact that Atari Works comes in (if it comes) doesn't mean
it is a good program. Granted, it is better than nothing.

|> As far as seperate commercial products, if you can name some specific areas
|> (other than video games, an area the Amiga has dominated...) I probably could
|> find comparable products fro the Atari.

SpreadSheets? ProCalc here on the Amiga, AREXX support so you can create
custom macros and inter-process communications among different applications.
You could even do an AREXX script that could get data from ProCalc on the tables
and run Scala and dynamically create pages for a presentation!

SuperBase-> database that can combine pictures/sounds plus other
advanced 'normal' database pictures. Also has AREXX.

ImageF/X and AdPro image processing programs-> Used for desktop publishing.
Image F/X currently used by Warner Bros. to imageprocess and color correct
new cartoons they are making. Provides virtual memory even in machines
that doesn't have mmu capabilities. AdPro has been used for Babylon 5 and other
places like in some movies.

Desktop video:

Real 3D V2.0-> Has inverse kinematics, macro language, AREXX support,
collision detection (throw balls down a flight of stairs
and they will bounce realistically all calculated
by the program).

Imagine -> Used a lot here and particularly a King of animation/raytracing
over europe, Artists have won raytraced picture contests
using this program.

Aladdin 4D-> Gases, and other features.

etc.

Multimedia: Cando 2.5, Scala MM210 (soon to be MM300), AmigaVision

Deskop Publishing:

DTP programs: ProPage 4.1
PageStream 3.0

Illustration programs: Pro Vector
ProDraw 3.0
Art Expression (PageStream guys)

The list is all bigger than this. Ok, waiting for the ST 'line-up'....

(BTW, in my opinion I know the Amiga crushes the ST in both
video and multimedia but since you said only the Amiga has dominated
games... well, you asked for it)

---

Disclaimer: It isn't my intent to go on much further than this. People
that have a huge software ST investment or that want music
and like the Atari's should probably go with a Falcon.

|> > Probably because they don't care. People are comparing also against the A1200

# 2230. Re: Atari vs the EXPENSIVE world of DOS (longer)

Newsgroup: comp.sys.atari.advocacy
Date: 1993-10-01 19:47:02 UTC
From: crissman@btree.uucp
Message-ID: <1993Oct1.194702.8863@btree.uucp>
Source record: 21068

I cut as much as possible, this this is still quite long. It covers
a *lot* of territory....

In article <9309301429.AA04766@IBX.COM> zim@IBX.COM (Bill Zimmer) gets
detailed and propounds:
>Yes, usually only *one* software package per application type is usually
>needed by the average computer user. However, because of the immense
>size of the MS-DOG market, they have a lot more packages to choose from
>and at many different price ranges.

The range of choices of, say, word processors, for the Atari platform
ranges from free (ST Writer) up to Word Perfect. Take your pick from
several offerings.

>Some stores are the pits. Not necessarily because of the size of the
>clone's software base, but because they just don't want to go that
>extra mile for the customer. My suggestion would be to have them
>watch a few Tom Peters lectures. Excellent customer service is
>out their and for all platforms.

I'm not about to tell a store how to run their business. My point
is that a store of talented, knowledgable, capable people selling
MS-DOS machines is just as rare as stores selling Atari products.

>>C) As soon as alternate software choices are discussed, someone
>> somewhere always blurts out that "if it's not Microsoft
>> Word and Microsoft Excel it's no good and I won't use it."
>> So why bother having a large base of software, anyway?
>
>Some people are just like that. Not everyone uses Microsoft products.

The point here was not that they were Microsoft products, but that
a great majority of users won't even consider alternate software.
That pretty much invalidates the need for a huge software base.

>Microsoft's advantage is that they have an agreement with most clone
>manufacturers to bundle their products with the computer. If Joe Consumer
>buys a clone, MS-DOG, Windows, etc. are usually already installed.
>Some stores will install OS/2 if requested. (However, the clone maker
>must still pay Microsoft their tithe even though MS-DOS (etc) isn't
>installed on the machine).

I believe that's called "restraint of trade", and is one of the
reasons that the Federal Trade Commission (FTC) and now the Justice
Department are investigating Microsoft. If found guilty of the
charges, there will probably be a *big* shift in Microsoft's advantage.

>Also, your answer reminds me of this newsgroup. Atari vs. The World.
>(The World is winning, by the way). (E.g., "If it's not Atari, it's
>no good and I won't use it.")

On a daily basis, I use an MS-DOS machine, an Apollo Computer, a
Hewlett-Packard 9000-series UNIX machine, and my Atari ST. The Apollo
is a joy to use, the 9000 works ok, the MS-DOS machine crashes
regularly due to Windows, and the ST quietly does it job quickly
and efficiently. Sure, I'm biased towards the Atari, but that's
because it provides a cost-effective solution to my computing needs.

>If you're not a musician, there are mighty few reasons to get an Atari.

Chapter headings from the International TOS Software Catalog:

Publishing And Graphics Music Business
Multimedia And Hypertext Education Entertainment
Personal Productivity Medical Peripherals
Connectivity And Communications Computer Aided Design
Development Tools & System Software Other Products

>>D) The cost of the software is incredible! For the MS-DOS
>> machines, you can buy WindowsNT for $279.00. On the Atari
>> Falcon (the 4/80 version) MultiTOS is *free*. And if you
>> decide to add MultiTOS to an upgraded Falcon (say, you add
>> a hard drive and memory to a 1/0 Falcon), the upgrade to
>> MultiTOS will only cost half as much, at the most.
>
>Agreed! This is usually the case because of the many business who have
>clones and purchase software. Some people swear by Word Perfect.
>Some people swear at it. (I'm in the latter category.)
>
>Some companies, however, equate price with quality and number of features.
>(Reminds me of a company in the Apple market many years ago that actually
>saw a sales increase with the RAISED prices.

And I thought that marketing truism only applied to ladies grooming
items and makeup! :-)

> People thought that a
>software package at that low a price had to have something wrong with
>it.

Like Turbo Pascal from Borland? A $79.00 compiler (complete), at a
time when compilers were $300.00 to $500.00. It's a shame that such
a fine product didn't grow and prosper in the MS-DOS world. What
ever happened to Borland, anyway? :-) (note the smiley!)

> If price alone ruled the market, Atari (and Commodore) would have
>more sales. Unfortunately, marketing affects sales more than price.

Agreed. I'm hoping that with the success of the Jaguar, Atari will
be able to increase their presence in the advertising of their
products.

>The more complex the software product, the greater the cost of
>support. The cost of support usually isn't included in the cost of
>the product. Rather than have the cost of support included in the
>cost of the product, it's fairer that those that need the support
>have to pay for it.

Why should I have to pay a manufacturer for the 'privilege' of identifying and helping to correct a bug (or flaw) in their software package? I agree that the cost of training the user should be borne by the user (Example: "How do I change a font in Calamus?"), but the cost involved in fixing a faulty product (Example: "The software adds two and two and gets five.") should be borne by the manufacturer.

> One reason that you may have had such good
>support might be that the Atari market is so small. What would be
>easier to support, an Atari product that sells (at most) a few
>thousand copies or clone product that sells many thousands of
>copies?

A small user base *also* means that each user is more important to the company. And that means more responsiveness to problems and to desired upgrades.

I've found that when I open a checking account with Massive Giant Bank (NT&SA), there are lots of rules, fees, employees who are "just following the rules", and the general feeling that I'm just another source of revenue to the bank. When I open a checking account with Small Town Bank, I find that I can qualify for a checking account free of fees, there are a minimum of rules, and when there is a misunderstanding it's more likely to be settled in my favor by people who actually understand what's going on.

From the user standpoint, bigness is highly overrated. I prefer responsiveness.

>Support people that CARE is what counts.

Amen.

>Of course, Atari has a 1-800 number for support. After all, you paid
>for the hardware, right? Shouldn't that come with some free support?

No, they don't have an 800 number. But then, they don't have a 900 number either (except for the 'cheats' line for the Lynx, if I remember right). And if I call the Sunnyvale office, I may have to pay the phone company for the cost of the call, but at least I'm not having to *pay* Atari to listen to me.

>Oh, and if you purchase Atari software, they have toll-free support,
>right?

Not to my knowledge. Why are you so infatuated with toll-free support? If you're on a budget, you can write a letter.

>How can anyone call Atari competitive? Maybe in MIDI applications.
>That's about it, however.

Check out the chapter titles in the International TOS Software
catalog, shown earlier in this posting.

>Jane/Joe Public vote with their dollars. Are they buying clones
>or Ataris?

According to Marc Barrett, they're all buying Apple MacIntoshes. :-)
Other posters in the *.atari groups are noting that when they show
their friends the Falcon, a great majority decide to purchase one.
According to posters in the *.amiga groups, their machine is doing
a great volume.
According to ... oh, let's see, now ... the venerable Skip Sauls,
the whole world sees only MS-DOS machines.
And then there are the Apollos (now manufactured by Hewlett-Packard).
The SGI Indigo. And more.

> When you count the computer ads in
>your local paper's business section, are there more Atari ads than
>those for Apple or the clones? Of the ten closest computer dealers
>nearest you, how many stock Atari, Apple, clones? Pick up a recent
>issue of Computer Shopper. Count the Atari ads. (Even when they had
>an Atari section, Atari ads were few and far between.) Go to a newsstand
>and count the number of computer magazines. How many are for the Atari?
>How many are for the clones?

I agree that Atari needs to bolster their marketing. To do that, they
need money. To get money they need sales. To get sales, they need to
boost their marketing. (There's a trend developing here.... :-).

>Are there computers where you work? If so, how many are Atari?

I haven't seen any Atari computers at work. Since they are considered
to be home computers, that's understandable.

> Just because you might think that Atari has the
>better hardware, that doesn't drive the market unless there's something
>that'll run on it. Do you think that a business is going to purchase
>Atari STs because they have a MIDI port while clones don't?

If you mean businesses such as the "Beach Boys", then yes, I do.

> Will
>companies purchase a Falcon because it has a DSP port but the clones
>do not.

Some poster pointed out that there *are* some DSP sound boards
available for MS-DOS machines. No, I don't think this would be an
overriding reason.

> Most companies have a large investment in software. Buying
>hardware that won't run the existing software would result in an instant
>pink slip.

When a company needs to get something done, they select the hardware
and the software that performs the job most efficiently and economically.
That's why you find machines from Silicon Graphics, Hewlett-Packard,
Apple, and others all on the same site.

> Can I get Word Perfect for the Atari?

Yes.

>(It took Atari how long to get a blitter??

I believe it was with the introduction of the MegaSTs in 1987 (or
thereabouts). Does someone have the exact date of introduction?

>It took the Atari line how long to get pre-emptive multi-tasking?

About as long as it took the MS-DOS world, it would appear.

>However, Commodore marketed their machines just as well as Atari marketed
>theirs. The end result is that both Atari and Commodore are distant
>also rans. The Amiga has a niche in the video market. The Atari has a
>niche in the MIDI market. That's it. They didn't market their
>hardware correctly.

I agree that Atari needs to bolster their marketing. To do that, they
need money. To get money they need sales. To get sales, they need to
boost their marketing. (There's a trend developing here.... :-).

>They're in the dust. The Falcon will not save Atari.

It looks like the Jaguar console is going to be the big money maker.

>So what if Atari software is cheaper? It's targeted at the ST/Falcon
>owner not to the clone owner. Atari 8-bit software is even cheaper
>than ST/Falcon software. Therefore, using your reasoning, Atari's
>8-bit computers are more competitive.

...and I'm certain the gang over in comp.sys.atari.8-bit would
agree with this reasoning.

>How'd I do? :-)

Overall, you raised many good points and supported your arguments
well. In addition, you didn't resort to name calling. I'd say
you did an extremely good job in your posting.

>If you'd take your Atari blinders off and visit the real world.....

Real World Approaching!

>There's a tremendous computer market out there and Atari is almost
>nowhere to be found.

True. For now.

>Total PC sales should INCREASE this year compared to last year.

True, the market for all personal computers should INCREASE this
year compared to last year, including Apples, Amigas, Ataris, MS-DOS
machines, etc. Given the current slump in sales for all machines
combined, the overall market is *bound* to improve.

>>>PCs rule not because their hardware is better than Mac/Amiga/Atari,
>>>but because
>>>
>>>(a) IBM licensed the technology so that clones could appear (resulting
>>>in a price war feeding frenzy),
>>
>>IBM didn't license the technology until after the clones had
>>forced their withdrawal from the market. (Someone at IBM probably
>>said, "Hey, they beat us up by using our own architecture! Let's
>>sue 'em for licensing fees. That'll show 'em, uh-huh.")
>
>But, IBM did license the technology.

Probably to avoid charges of "restraint of trade" and the ensuing
investigations from the Federal Trade Commission and the Department
of Justice. (Just supposing, here....)

>Meanwhile, Atari won't even license their 8-bit technology.
>GEM could've caught on if it had been marketed correctly.

GEM was originally conceived by Digital Research as an operating
system that would work on a wide variety of platforms, beginning
on (surprise!) MS-DOS machines. With their initial success, they
announced a port to the Apple MacIntosh machine and got hit with
a legal action by those fun-loving Apple Attorneys. There was an
out-of-court settlement, in which DRI agreed to drop GEM forever
(or something along those lines).

Apple would have come after Atari, as well, but for the "save and
hold harmless" clause in the license agreement from DRI to Atari.
GEM *can't* catch on (as originally intended) because Digital
Research is prohibited by it's agreement from working on it any more.

I agree that Atari needs to bolster their marketing. To do that, they
need money. To get money they need sales. To get sales, they need to
boost their marketing. (There's a trend developing here.... :-).

>>>(b) Business trusts the IBM name (it didn't hurt that many businesses
>>>were already using IBM mainframes),
>>
>>Given their recent financial difficulties and first-ever layoffs,

>>continue doing business with IBM, but not as enthusiastically as
>>in the past, and they'll be open to alternate sources....
>
>IBM is a HUGE company. They'll survive their recent financial
>difficulties.

American Motors Corporation was a large automaker. Now when you say the initials 'AMC', most people think of a chain of movie theaters (at least here in San Diego, anyway) and not a domestic auto manufacturer. Bigness is not necessarily an indicator of the ability of a company to survive.

Or how about the collapse of Continental Illinois Bank several years ago? It was, hmmm, the third or fourth largest bank in the United States? It's history now. They didn't survive that well....

>>Atari computers are considered to be business machines in Germany,
>>and that's where a lot of the business software comes from. ("Big
>>deal," he says.) Atari is not marketing their computer as a business
>>machine (although it can be used for business) in the United States --
>>they're marketing it as a home computer. Different market, different
>>needs.
>
>Dismal sales. The word from some recent postings is that Atari is
>now losing market share in Germany. There goes your one stronghold.

I was relying on an old Atari brochure when I made that statement. I've retracted it twice on this forum based on new evidence. I'm willing to retract it again, if you so desire.

>Most home computer users purchase machines that are compatible with
>what's at the office. (Just like when Apple years ago used to control
>the education market. Many parents bought an Apple II for their
>children because that's the computer that was at school.)

There's a good reason for your home machine to be different! There was a virus that got loose at my former employer's place of business. There was a lot of posturing about how they were going to find the culprit and charge him/her the cost of eradication and replacement of data and programs. (We're talking tens of thousands of dollars, here!)

Each one of us was individually interviewed about our computing styles and our home machines. Most interviews lasted about 45 minutes. Mine lasted two minutes, because the first question was "What type of machine do you have at home?" When I answered "An Atari ST", I was considered to be incapable of causing virus damage, because everyone *knows* that IBM's are *not* compatible with Atari computers.

(BTW: They virus was being inadvertantly spread by the system administrator during the routine monthly check of the machines. Because he was management, I suspect the forgot all about charging anybody any money....)

>We differ on this. Atari doesn't have the software that I want to run.

That's what it all comes down to. If you can't find the software you need/want, it doesn't make sense to purchase the machine. No matter how massive the software base may be. The Atari has a good selection

of software (see previous listing from the International TOS Software Catalog, above), but nobody says you have to actually like any of it.

>Even if they did, I would be very hesitant to buy Atari hardware knowing
>that they might leave the computer market. (Pity those people who bought
>the XE game machines, and 2600s, and 7800s, and whatever else).

Which of those are computers? (Hint: none of them!)

>>One drawback of the price wars is that 'cheaper' parts are being used
>>that are more likely to fail.

>Do you have any proof of this??

I see occasional articles in the computer press warning about this. It's especially prevalent in areas of cutthroat pricing (such as San Diego). In order to compete on price, manufacturer's must push the limits as far as they can. And since the standard reasoning is that the system will be upgraded every two to three years, components and systems are only designed to last two to three years.

>Maybe they're cheaper because of economies of scale and not because they're
>more likely to fail.

Maybe. Given the willingness of MS-DOS users to a) buy frequently, and to b) look for a low price, it's more likely that quality is being sacrificed, as reported in the computer press.

>Just because something is inexpensive doesn't mean that it is more
likely to fail.

True.

> (Since software for the ST/Falcon is
>cheaper than the equivalent software for the clones, then the ST/Falcon
>software is more apt to be bug-ridden and more prone to failure.)

A clever point. However, Atarians are much more price sensitive than MS-DOS users. Where an MS-DOS user would think nothing of plunking down $100.00 for a video card, the Atari user will demand that it should have been built-in as standard at no extra cost.

>>>Actively?? Marketing it where??
>>
>>Just recently, right here in San Diego and Glendale: once to a general
>>computer faire covering most platforms, and once to an Atari-specific
>>gathering.
>
>Wasn't it a user group that was showing the Falcon at one of the shows?

I would assume the Glendale show, because I wasn't there. The other poster that alleged the demonstration was by the user group was from Canada, and wasn't at the show either. To the best of my knowledge.

>>It's true that the advertising needs to be increased. And it's true

>Atari's been "working" on this for a number of years. It's only getting
>worse, not better. If we'd get as much marketing out of Atari as we
>get hot air.....

Displaying at shows such as the San Diego Computer Fair (where they'd
never been before) in addition to existing shows like CeBIT shows they
are increasing their presence. That's not worse, that's better!

>Until Atari get's their machines in mainstream computer stores, they're
>not going anywhere but down, down, d
> o
> w

>
>To make matters worse, most Falcons are being purchased by ST owners.
>Atari isn't increasing their customer base. They need to convert people
>from other platforms to dump their Mac/clone and get a Falcon. Consequently,
>the Falcon market will be even smaller than the ST market.

Marketing is increasing, ST owners *desire* a Falcon, and friends of ST
owners are reported as *desiring* a Falcon after a demo. Signs are pretty
good that the Falcon will be well-received. It remains to be seen if your
prediction is true.

I used PageStream 1.8 a lot on the ST. Nothing about it reeked of assembler
code being exclusively used (i.e., it wasn't any faster than competing
products at displaying graphics or rendering a page) but I'll take your word
for it....

I still think if they are going to port to various OSes, why not then port
to the Mac, where they have 680x0 processors?

(their GUI environment shouldn't have been any harder to port to than the
Amiga and ST versions)

Ok, I'll agree with that. Although I have to also say that presentations
tend to be stuff that you don't see people doing everyday.

(for example, a college student rarely gives a presentation via computer, they
usually type a report up and submit it :) )

>Graphics design of any kind, including CAD, rendering/modelling,
>paint/draw.
>

I'd label these all under "graphics software" which, for the Amiga, is great.

>Professional video editing. I'd venture to say professional audio as
>well, through something like Studio16's setup.
>

I'd have to disagree about professional audio editing, though. The ST has
far more products and most of them geared towards the musician/producer.
We had one of the first Direct-to-Disk recording systems (Hybrid Arts'
unit) and it used to get sold bundled with an ST or STe to use it with.

(similar to the Toaster bundle on the Amiga)

>And, of course, emulating a Mac. ;)
>

I haven't seen the Empland... what type of Mac does it emulate? On the
ST we're still stuck using 128k ROMs w/ mono Mac support.

Did they? I disagree with that... Pagestream 1.8 was shipping when Calamus
came out on the ST. When they made PS 2.0, Calamus was competing with their
Calamus 1.09ST product.

So you're definitely wrong on that.

Yeah, but even if they only made minimal market penetration as a low-end tool
for DTP, they would probably sell as many as they do on the ST/Amiga line
given that there are just that many more Macs out there.

>

Hmmm.... that's strange. Around here we even have print shops that accept
documents in Calamus or Postscript format!

> Where can I check out Calamus? Any brochure/add somewhere?
>

Calamus is marketed by ISD Inc., in Canada. I think if you read in the
newsgroup comp.sys.atari.st long enough, you'll spot John Hutchinson of
Fair Dinkum who is a member of the IAAD (group of developers) and he
could forward you the info on the company, i'm sure.

<this is assuming you can't find a dealer... it's probably THE DTP package
on the Atari!>

>
> Is it really? Weren't people complaining that it wasn't finished yet?
>Also the mere fact that Atari Works comes in (if it comes) doesn't mean
>it is a good program. Granted, it is better than nothing.
>

Well, MultiTOS is flawed. The AES portion has not been re-written to run
*fast* under the multitasking, multithreading OS. It hogs the CPU. :(

However, it does work, and on a fast enough machine (Falcon or TT) it apparently
is pretty nice...

Atari Works... I've heard mixed stories. No one has flamed it (of the people
I've seen who OWN it) but some who paid $109 for it retail felt it should
be no more than $80 or so. Those who have gotten it bundled seem to like it.

:)

<who doesn't love a freebie?>

But it's a nice product.. and complete... in fact, here's a blurb on it
from a mailing I got from Toad Computers:

...Includes a word processor, a spreadsheet and a database. Word-like
word processor is a breeze to use and includes a complete thesaurus and
spelling dictionary (the same ones used with Lotus Ami-Pro). Full featured
Excel-like spreadsheet allows use of scalable fonts. Database is dBASE
file compatible and is graphically oriented.

- supports Microsoft's RTF format for easy cross-platform file transfer.
- cut and paste between Works modules and system clipboard
- DB supports tab and comma delimited file (is this something to brag about?)
- advanced, easy-to-use mail merge and label printing
- open multiple modules and data files simultaneously (i should hope so, with
a multitasking OS shipping with it! :) )
- include graphics in documents
- database produces charts and graphs easily and quickly

From what I saw of it in beta, it seemed pretty nice, although i have not
used the final product.

CO> Well, not all Atari machines that aren't Falcons are 8 years old.
CO> What about one, two or three year old STEs or TTs?

The TT is still produced, I call that supported!

STE:s are what .. 88-89 .. that's 4-5 years old ..

CO> How? Perhaps with Screenblaster? Oh yes, 1280*960 at 87 Hz interlaced.
CO> This results in a real horizontal frequency of 43.5 Hz and is simply
CO> ridiculous. Nobody can work for more than 20 minutes in that mode,
CO> except when he/she has fun in torturing the eyes.

No need to interlace that mode, just use monochrome as the TT and the bandwidth
can handle it.

CO> In the TT the FPU is standard and you don't have to pay anything extra for
CO> that.

What about those who has no use for it at all? (It doesn't speed up ALL math,
just Floating point .. how often does a program use that?)

CO> The later series of the TT don't need an extra FAST RAM board.
CO> It's also standard and again you don't have to pay for it.

Sure, at extra cost.

CO> |> What you gain? Can you say SOUND&GRAPHICS very fast? :-)
CO>
CO> CPU speed, FPU, FAST RAM, much higher resolution with a sharp
CO> and absolutely flickerfree picture. Everything without extra
CO> costs.

Yep, and then a decent graphics card costs LOADS of money, what about sound?

What about 640*480*256? 800*600*256? All without extra hardware, right out of
the box ..

The ONLY reason for not switching from the TT to the Falcon is the 16Mhz CPU
...

CO> Ok, of course there also are problems in the PC world when it comes to
CO> upgrading a machine. But generally, it's much easier and also cheaper.
CO> Nobody can deny that.

Well, I do .. :-) ...

RH> Also the mere fact that Atari Works comes in (if it comes) doesn't mean
RH> it is a good program. Granted, it is better than nothing.

It's very good for being a bundled package!

RH> (BTW, in my opinion I know the Amiga crushes the ST in both
RH> video and multimedia but since you said only the Amiga has dominated
RH> games... well, you asked for it)

The A1200 don't, base model hasn't got a harddrive, and there's only 2 meg RAM
to play with.

RH> Disclaimer: It isn't my intent to go on much further than this. People
RH> that have a huge software ST investment or that want music
RH> and like the Atari's should probably go with a Falcon.

Anyone wanting to use a SERIOUS 680x0 computer, not playing games, will like
the Falcon.

It's quite obvious you haven't used one.

RH> Not if you are going for desktop video, multimedia or you are in a very
RH> tight budget (I think the Atari loses in all those three categories).

Commodore, just as Atari, is loosing their market to clones ... the PC has the
games before the A1200 according to the latest issue of "Attack" here in
Sweden, they also report that Commodore doesn't seem to be backing the CD32 at
shows.

Commodore might want to rethink hinging their success on the CD^32. My friend
got his long-awaited 3DO yesterday (for local people, Babbage's at PG Plaza,
in MD got them, everyone else has them of today, i think). I played it and
I'm impressed. The graphics resolution isn't as good as I had expected, but
the speed and fluidity of movement when you are actually playing is excellent.

It does have to load from CD at various times, but it isn't as big of an
inconvenince as it is on a Duo or a Sega CD.

With the system comes a nice "Road-Blasters" type of game "Crash 'N Burn" which
is on par with an arcade machine, EASILY. The real time texture mapping
is fast. The road, sky, etc.. all look beautiful (although there are some
jaggies in the images which i didn't expect, but it looks better than anything
else I've seen on computer or console games).

Anyways, after seeing and playing a 3DO, I think the CD^32 is in deep trouble.
This thing is incredible and they have strong support from 3rd parties, many
of whom are known on the ST and Amiga (like Psygnosis, MicroProse, Crystal
Dynamix, etc...).

The system comes bundled with cartoons! :) It has some nice ones, too...
plays back an episode of Batman: The Animated Series, a Hanna-Barbera one
called "Two Stupid Dogs" and 2 or 3 others.

Also, interestingly enough, they have a little demo that lets you see previews
(mostly still screen shots like a slideshow) of coming games. Some with
animation look very impressive... still shots of games on here look much
less impressive than they do when seen moving at the speed this thing goes.

Re: Atari Jaguar

Apparently, when my friend picked up his 3DO he asked the salespeople about
Jaguar (which he also has on order from a CA shop) and apparently the rumor
is (and that's all i'd say it is) is that the Jag's CD unit will be "3DO
compliant", and will cost $100 than the announced price (closer to $300).

This would seem contrary to Atari's 3DO-comparisons they've been making....

(but it would be smart to stand behind the standard, i guess)

If Jaguar doesn't get some games that can show off its capabiltiies, 3DO will stomp it. Of the initial release, Alien vs. Predator and the Trevor McFur game look to be the best... I should have more news within a month (when we should have one!)..... :)

>>

>MSX did really well in Japan, didn't it?

Are you guys kidding?????

In Europe (certainly in Holland) MSX was THE competitor of the C=64
in the days of home computing. Evrybody had to had an MSX computer.
A couple of dozen companies produced them. Philips, Sony, Yamaha (with
special sound hardware), Goldstar were among them.....
They were based on the Z*80 processor and normally had 32K to 64K RAM
and some video ram. Some of them even went to 512Kb of RAM.
Many many games existed for them and you could also tun CPM on the most
powerfull MSX machines.

Just for the record,

Leon.

: I used PageStream 1.8 a lot on the ST. Nothing about it reeked of assembler
: code being exclusively used (i.e., it wasn't any faster than competing
: products at displaying graphics or rendering a page) but I'll take your word
: for it....

One of the biggest things that was mentioned about the upcoming release
of PageStream 3.0 for the Amiga was that it was a total rewrite (in C, I
believe) from the earlier versions, all written in assembly.

: I still think if they are going to port to various OSes, why not then port
: to the Mac, where they have 680x0 processors?

Competition. On the Amiga, they only had to compete with Pagesetter.
Even then, the Mac DTP market had a few too many players.

: Ok, I'll agree with that. Although I have to also say that presentations
: tend to be stuff that you don't see people doing everyday.

That depends. Some people get hired to do that kind of thing. But
you're right. :)

: I'd have to disagree about professional audio editing, though. The ST has
: far more products and most of them geared towards the musician/producer.
: We had one of the first Direct-to-Disk recording systems (Hybrid Arts'
: unit) and it used to get sold bundled with an ST or STe to use it with.
: (similar to the Toaster bundle on the Amiga)

For example, the Studio 16 software and AD516 hardware gives you MIDI,
SMPTE time code synchronization, non-linear editing/recording (with
direct to HD support) studio. 8 track, 16-bit stereo, 44KHz. "Designed
for the needs of the video professional."

It's a pretty kick-ass card for video work.

: I haven't seen the Empland... what type of Mac does it emulate? On the
: ST we're still stuck using 128k ROMs w/ mono Mac support.

Emplant is doing the 256K roms now; I guess it'll be able to use the
bigger ones in the future.

Greg

> need MultiTOS to do that on my ST?

Like the PC, you just need the right tools. Try this:

ACCs - MaxiFile, STalker 3 or Connect
Run - your word processor

Voila; and the file transfers will even work (unlike modem work under
Windoze).

Or maybe try this (unde MiNT):

ACCs - TOSWIN
Run - your word processor

Open a shell in TOSWIN and a text-mode term program and voila; the
multitasking will help for other things, too. Usually when I do this, I
load TOSWIN as an ACC, open a shell and MicroEMACS, then run STalker as
a program (I have problems loading ACCs under MiNT for some reason; much
like every PC I've ever used has sever problems when you add network
drivers).

Works pretty good, even on such a pathetically slow system (Warwick
refuses to send me his TT! :-).

On a Falcon040, this setup would be great; when will Atari release
one?!?

"The PC has the games before the A1200"? You don't think you're
generalizing a tad bit too much here, do you? Sure, SOME games
are released first for PC machines, but most european games are
still released on the Amiga first. Some games aren't released for
the PC, just like some PC games are not released for the Amiga.

Amiga titles still sell more than PC titles in Europe, despite
what people seem to think. Just like SEGA outsells SNES.

>they also report that Commodore doesn't seem to be backing the CD32 at

Uhm.. care to clarify? That's a very ambiguous statement.

Not that "Attack" is the most reliable source of information,
either - not unlike most swedish magazines, including DMz.

Nope. Read my post elsewhere. The Mac had something better than 1.8, so
the competition there would be fierce, and the Mac OS is notoriusly difficult
to program compared to the Amiga (and I think even compared to the ST).

[stuff deleted]

Well, depends if you are at a graduate level/undergraduate level and the class.
In my college campus I have had to give 3 presentations, and in corporate
business you have to do more presentations than you might think. Trust me
on the last one...

|> >Graphics design of any kind, including CAD, rendering/modelling,

Ah. Interesting. They are three different areas anyway. People that
do cad, don't necessarily (and usually don't do) 2-D painting.

I'll like to see the ST solutions, because Studio 16 seems to be selling
more and more each time and has gained some very good comments lately.
And BTW, they just came out with a new versions. People that are using
the Toaster for video, are using Studio16 to edit their audio.

The Amiga emulates a MacIIcx in full color. I saw that running Adobe
PhotoShop *AND* the nice part: It multitasks with the Amiga. So you drag
a screen down and you can see the Mac 256 color screen 'beneath' it.
Looks truly amazing :-)

There's a difference though. Atari has admitted that the Falcon
is not selling well, and there's official numbers of over 200,000 A1200's sold.

|> to play with.

Yawn. The A1200 don't DUH! Are you moron or what? $1000 for a '030 hardisk
equipped A1200. Crushes a Falcon for video.

|> RH> Disclaimer: It isn't my intent to go on much further than this. People

And you think the A1200 is just for playing games? Talk about waking up...
Gee, I guess those corporate presentations I did with Scala 3 months ago
were just games, aha....

|> It's quite obvious you haven't used one.

It's quite obvious if I wanted serious mainstream applications
on a 680x0 machine I'll buy a Mac. Crushes both the Falcon and the Amiga.

|> RH> Not if you are going for desktop video, multimedia or you are in a very
|> RH> tight budget (I think the Atari loses in all those three categories).
|>

|> Commodore, just as Atari, is loosing their market to clones ... the PC has the

False. Atari lost its stronghold in Europe thanks to the Amiga 500.

|> games before the A1200 according to the latest issue of "Attack" here in
|> Sweden, they also report that Commodore doesn't seem to be backing the CD32 at
|> shows.

Well, is 'ATTACK' an ATARI magazine? That wouldn't surprise me.
The latest WOC here in the US had CD-32. Shows in Europe of the CD-32
have been conducted showing the real-time Mpeg player module.

Are you making this up or is 'ATTACK' and ATARI magazine?

AND BTW, most european games are released in the AMIGA *BEFORE*
the PC. Ocean, Team 17, Illusions, Psygnosis, BullFrog... Dude, some
of those companies don't even release on the ATARI's anymore!

C='s is already selling well the CD-32 in Europe already.

|> My friend
|> got his long-awaited 3DO yesterday (for local people, Babbage's at PG Plaza,
|> in MD got them, everyone else has them of today, i think). I played it and

|> the speed and fluidity of movement when you are actually playing is excellent.

There's a big problem Flip. $700. 3DO is good and excellent, but while
at this price, don't think it would be a 'mainstream' unit.

Until 3DO doesn't come down in price, I don't expect it to sell a lot
no matter how good is it. Remember the NEO-Geo?

Now, I admit the thing that C= has to worry about is the ATARI's Jaguar.
This depends on how good the software ATARI is going to put on the machine.
So far the software line-up for the Jaguar doesn't look good against the CD-32.

This could change later on, I admit.

|> It does have to load from CD at various times, but it isn't as big of an

Lines: 33

It's time again for that fun filled game, let's see how stupid the emploees
are at the ELECTRONICS BOUTIQUE!!!!

Question 1: When is the 3DO coming in?
ANSWER 1: Well, the 3DO has been put on hold until games come out.

QUESTION 2: What about that new one by Atari, the Jaguar?
Answer 2: Well, its been in Japan for about three months and hasn't been
selling well. So atari is going to test market it next year
in New York and San Francisco.

QUESTION 3: What's the price on the 3DO?
Answer 3: We don't have a price yet because we aren't going to get them
just yet. I've heard the top price is $250.

Other stupid stuff:
I can't see why atari can put out good software like other
japanese companies.

The 3DO is being made with IBM

The Lynx was discontinued a year ago.

Would you be interested in getting Street Fighter 2
for your Genesis?

Humor has no limits.
the electronics boutique.

Mark Santora

------------------------8x CUT HERE

The Jaguar CD being 3DO compliant most likely translates to (if at all true,
wich sounds like something ATARI would say, but of course, they'll be hyping
to no end):

"We can read the 3DO CD format"- that's it, end of story.

>>>>>>>>>>>>. BTW Flip, if the Jaguar is going to be sold for $300 without
a CD, then I truly can see the Jaguar in trouble, unless
Warner do their job.

|> This would seem contrary to Atari's 3DO-comparisons they've been making....

Read above, no surprise. AND BTW, when have ATARI comparisons being
really true? Ha!

|>
|> (but it would be smart to stand behind the standard, i guess)

DREEEEEEEEEEEEEEEEEEEEEEEEEAM ON.

|>
|> If Jaguar doesn't get some games that can show off its capabiltiies, 3DO will
|> stomp it.

Absolutely true, if the 3DO can lower their price quickly. But if I had
to chose between 3DO and the Jaguar being around as the standard, I guess
I'll prefer 3DO because they know how to do their support very well.
Atari doesn't (the same goes for C=, I'm objective).

|> Of the initial release, Alien vs. Predator and the Trevor McFur
|> game look to be the best... I should have more news within a month (when we
|> should have one!)..... :)

I agree it sounds nice for the Amiga owner who needs to do this kind of thing
and prefers the Amiga environment...

However, I think the Atari has more options for work in that area. I wouldn't
say the Amiga CAN'T do a good job, only that the Atari would have more tools
and probably be more widely recognized in the field.

(heck, we can do decent video/presentation work on Ataris.. but the s/w and
h/w is not well known... i recently got a nice brochure from Cybercube who
make a video card that is comparable to a Toaster... and Lexicor, another
company, makes a nice set of programs that would complement that nicely, BUT
I don't see them with their own magazines, a la Video Toaster Magazine. :) )

Well... let me say this... I think if you heard the story from an Atari exec,
they'd say (to cover their butts) that PageStream stopped ST support because
Calamus was whipping them. (In fact, Atari had bundles with both Timeworks
DTP and/or Calamus DTP at one point, but NEVER with Pagestream! that might
be the reason for some animosity between the two companies).

Likewise, I doubt a Pagestream employee would say:

"Calamus kicked our butt on another platform, so we're porting to Amiga where
the competition is not as good."

In this case, i think the only people who know wouldn't tell. :)

Well, frankly... that's Europe, not America. Remember, MSX computers and
the FM Towns did well in Japan and Europe and I see not a bit of American
support.

Heck, as an Atari owner, I know that all the support the other users get around
the world means nothing unless the product finds it way here (something we
lacked a lot in the American scene for STs until '90 or so).

I agree. But it is more widely publicized and has several advantages:

1) it's not just a game machine. CD^32 and Jag both are just game boxes.
2) there is nothing delivering even CLOSE to its performance even at that
price (i would frankly say no PC I've seen is capable of doing what it
can do, because computers tend to be more generic to be good at a wider
variety of things).
3) they have over 300 companies supporting them.

That's about 200 more than we will probably see initially support either of
the competing machines.

> Until 3DO doesn't come down in price, I don't expect it to sell a lot
>no matter how good is it. Remember the NEO-Geo?
>

Neo-Geo had no major titles to sell it. I've played Neo-Geo. Sengoku was
nice... but now, they have a few hits (too late, i think) in the arcade,
i.e., Samurai Shodown, Art of Fighting, etc... But 3 games can't sell a
$500 system if the games are $150 a pop!

(in fact, Dragon's Lair on 3DO will cost $20... we'll be playing that early
next week, we hope!)

> Now, I admit the thing that C= has to worry about is the ATARI's Jaguar.

Jaguar is a threat to both, but... they lack a major title to hook the public.
Aliens vs. Predator looks to be excellent, and Trevor McFur seems to be a
competent shooter. But they need a major conversion, and they would need
to get some s/w out that demonstrates clearly the advantages (graphically)
of their machines.

>This depends on how good the software ATARI is going to put on the machine.
>So far the software line-up for the Jaguar doesn't look good against the CD-32.
>

That's true, but CD^32 costs $400 and is (like Jag) "just a game machine". The
3DO is "transcending" the games market and pushing themselves as fully
interactive TV, a step beyond your VCR and videogame system. (and it is!)

> This could change later on, I admit.
>

Could change real quick based on units for sale.

>|> It does have to load from CD at various times, but it isn't as big of an

>
> I don't think so, as long as the price difference keeps. BTW, don't you
>think that the Jaguar isn't in big trouble if the CD-32 is?
>

Jaguar has some advantages on 3DO:

1) bigger price differential.. it is $500 cheaper than Panasonic's and
$350 cheaper than the forthcoming Sanyo 3DO. The CD^32 will be
$300 cheaper than the Panasonic and only $150 cheaper than the Sanyo.
Against the Panasonic, both look good price-wise, but the Sanyo model
may complicate things considerably. For $150, people will go with the

3DO over CD^32, i think.

2) the Jag has comparable, if not superior, technology in its chipset. The
CD^32 chipset is (even if only slightly, it is noticeable) behind both.
Especially in terms of the "real-time texture mappnig" which is an
effect you have to see to believe. Crash 'N Burn blew my socks off on
a "glass" speedway that was set up in the sky. It was beautiful.

Ok, here's a zinger. The 8/16 bit SNES can 'blit' pixels at 1 million per second. The 32 bit 3DO will blit at 16 million per second, and the technologically 'comparable' Jaguar will (snicker) do...

850 million

Allen

Are you joking? Where's the 'American ST support?' It is still lacking...
Europe was also the 'ATARI' stronghold.

|> >|> My friend
|> >|> got his long-awaited 3DO yesterday (for local people, Babbage's at PG Plaza,

|> competent shooter.

Alien vs Predator-> yes, Trevor McFur.... well....

|> But they need a major conversion, and they would need
|> to get some s/w out that demonstrates clearly the advantages (graphically)
|> of their machines.

I agree.

|>
|>
|> >This depends on how good the software ATARI is going to put on the machine.

|> >So far the software line-up for the Jaguar doesn't look good against the CD-32.
|> >

|> That's true, but CD^32 costs $400

Retail. SafeHarbor (mail order company) plans to sell it for $340 and
the price might well go to $300 ASAP (Jan '94).

|> and is (like Jag) "just a game machine". The
|> 3DO is "transcending" the games market and pushing themselves as fully
|> interactive TV, a step beyond your VCR and videogame system. (and it is!)

And what about Video CD on the CD-32? C= has already shown the
card.

|>
|>
|> > This could change later on, I admit.
|> >
|>
|>
|> Could change real quick based on units for sale.

Yep. What I expect of 3DO: A huge yuppie-latest-thing-frenzy buy,
wich won't be a lot and after that silence... 'till the price comes down.

|> Against the Panasonic, both look good price-wise, but the Sanyo model
|> may complicate things considerably. For $150, people will go with the
|> 3DO over CD^32, i think.

Ah, how much we like to twists facts to our own preference, don't we
Flip? First you say the price isn't important and now you say it is
important. Hilarious.

The Jaguar on one end won't have a CD. This could be good.... or bad.
Even a CD-32 could do better games against a cartridge based Jaguar until
you put a CD-ROM to the Jaguar.

BTW, the price difference is bigger than $150 (CD-32 and the Sanyo).
And when the Sanyo will come out?

|> 2) the Jag has comparable, if not superior, technology in its chipset.

I wouldn't say that the Jaguar has superior hardware to 3DO,
but I would say they are on the same ballbark most likely.

|> The
|> CD^32 chipset is (even if only slightly, it is noticeable) behind both.
|> Especially in terms of the "real-time texture mappnig" which is an
|> effect you have to see to believe. Crash 'N Burn blew my socks off on
|> a "glass" speedway that was set up in the sky. It was beautiful.

True. But we'll see for the Jaguar. I agree the Jaguar looks better,
but let's see how ATARI get's 3rd party support. Having a company
like Psygnosis behind the CD-32 *AND* Electronics ARTS (wich also
develops for 3DO) looks very good indeed. Mortal Kombat is on the line-up
too. Jurassic park for the CD-32 will do 3D/Wolfstein/Alien vs Predator
type things.

The Jaguar needs something else.

|> >|> This thing is incredible and they have strong support from 3rd parties, many

AH, but there's a problem with that little magic number:

When ATARI said that, did they reffer to 24-bit pixels or 1-bit pixels?

You know, marketting can cloud things up in very interesting ways.

And at the very end, even if they are 24-bit pixels who gives a damn
if the end result is the same? BTW, your 3DO spec is wrong:

It is 64 million.

Yep, but the trick is that if ATARI doesn't take advantage of the time
they have now, they will be crushed by 3DO in the future.

Are you really gullible enough to believe that crap? There's no way the
Jaguar CD can be "3DO compliant". It does not have the hardware nor the
operating system that the 3DO has, and emulation of the ARM processor is
not feasible. In order to run 3DO software, the CD unit would need to
contain 3DO ASIC's and software.

>Yes, but, what's the price of the 3DO? Sure, families MIGHT buy it, but
>comparing a $199 Jaguar with a >$499 3DO ($799?), I know what kids'll buy ..

I don't really see *kids* buying either of them. The 3DO is too expensive,
and so will the Jaguar's games be, because of the obscenely high cartridge
manufacturing costs. Your average kid can't afford to shell out $70 on a
game, let alone $700 on a fancy CD player. Parents and 16-30 year-olds
will probably do the buying.

Either way, I hope either system succeeds. I would love to have some
decent hardware to play with (i.e. program).

My ST was shocked to learn that NetHack is Falcon-specific; even
Warwick's 16-colour GEM version works fine on it.

What about people with no net access? No Falcon software! Ouch!

>

No your point *was* how great the CD^32 would have support because it
existed in Europe. Now you're switching the topic.

Also, as far as I am concerned, the CD^32 is vapor. Why? It isn't in
America. When Atari releases products in Europe, I call them vapor until
they exist here. Why should I cut Commodore any slack on this?

>|>
>|> Heck, as an Atari owner, I know that all the support the other users get around

>Europe was also the 'ATARI' stronghold.
>

You misread what I wrote. :) I meant that until around 1990, we didn't get
any software here from Europe. Especially not the professional packages. A
lot of smaller houses over here (noticeably CodeHead and Gribnif) began
importing high-powered apps from Europe (check out Avant Vector) until then.

>

You're dead wrong. You have not seen a 3DO probably, nor played it. I have.
The sample disk that comes with it emphasizes its uses as a total multimedia
machine. Games play a significant role, but it they give a lot of time to its
abilities to do more... especially as a CD-ROM and Photo-CD reader.

(in fact, I've used both the Kodak Photo-CD and the CD-I from Phillips for
Photo-Cd purposes and, believe it or not, the 3DO has more flexible zoom
and rotation possibilities than either!)

You're blowing it out of proportion. Think of it like this...

You might be willing to spend $10,000 on your typical car. If someone said
they'd get you a Porsche for $17,000 i'm sure you'd definitely consider
spending the extra $7,000 to get the superior vehicle at a price much less
than its percieved value.

>|> 3) they have over 300 companies supporting them.
>
> Really? Just because people have signed up, doesn't mean they got

>a 'wait 'n see', or 'keep me informed' attitude.
>

Once again, you have not seen the machine. On the sample disk alone, we see
about 20-25 DEMOS on CD-ROM of titles in development.

Even if 200 of them are playing wait-n-see, they are signed up.

So did Neo-Geo.

:)

But, for some reason, believe it or not, they are still around.. even with
fewer units than we'd even consider a success in the console market.

3DO will likewise persevere for at least a few years.

>

In January of 1994 the Jaguar would have been on sale for 3 months and the
3DO will have far more recognition and the CD^32 will look like a blatant
copycat attempt by C= on this side of the Atlantic IF it doesn't offer some
strong titles to back it up.

Right now, Atari is just beginning to recieve some good press... I heard
today that in a game mag they have on the cover a 3DO being chased by a Jag
(can anyone give me the name of it? I'll try to dig this up myself... i
had the misfortunate of overhearing this while playing on the 3DO and trying
to NOT get killed in Crash 'N Burn :) )

>|> and is (like Jag) "just a game machine". The

>card.
>

*cynic mode on*
Are we supposed to believe they are gonna ship it? How long have they had
their AT&T 3210 DSP card "shown" or "ready" for the Amiga to bring it up
with the Falcon and DSPed Macs?
*cynic mode off*

Well, Video CD is nice. But this is nothing CD-I and 3DO won't be able to
do. And all of them have to offer the FMV as an addo-on board.

(which costs)

>|> Could change real quick based on units for sale.
>
> Yep. What I expect of 3DO: A huge yuppie-latest-thing-frenzy buy,
>wich won't be a lot and after that silence... 'till the price comes down.
>

That may be the case. If so, the only beneficiaries would be Atari (who is
generating demand for Jag, dealers in CA got some test-units, and seem very
impressed on the phone), and Sega (who has a big-budget item in their CD unit
which could stay profitable a bit longer if 3DO fizzles a bit).

>|> 1) bigger price differential.. it is $500 cheaper than Panasonic's and

>
> Ah, how much we like to twists facts to our own preference, don't we
>Flip? First you say the price isn't important and now you say it is
>important. Hilarious.
>

No, I was simply saying that if price WAS important... which it is... the
Jaguar benefits more than the CD^32 in the comparison against 3DO.

(at least the Panasonic one)

I still haven't gotten the price on the AT&T 3DO.

> The Jaguar on one end won't have a CD. This could be good.... or bad.
>Even a CD-32 could do better games against a cartridge based Jaguar until
>you put a CD-ROM to the Jaguar.
>

Sure, right. Does the CD^32 display 16.8 million colors at once? Or is it
using HAM8 to fake it with 200,000+ plus? uh huh. And I'm sure it has a

nice high rez display and all the real-time texture mapping in hardware for speed.

Yep, that CD^32 is a killer box... they basically take an A1200, which is an ok computer, and try to make it a game machine against boxes with 64-bit graphics and Blitter chips (remember, A1200 has a 16-bit blitter!) and sell it for $200 more with a CD-ROM.

Basically, the hardware in the CD^32 in no way is superior to the Jaguar. A cartridge based Jag is capable of whipping it soundly.

(for half the price)

> BTW, the price difference is bigger than $150 (CD-32 and the Sanyo).
>And when the Sanyo will come out?
>
>|> 2) the Jag has comparable, if not superior, technology in its chipset.

>too. Jurassic park for the CD-32 will do 3D/Wolfstein/Alien vs Predator
>type things.
>

Jurassic Park on the 3DO will be better, though.
Remember, if they stick to A1200 chip specs, they'll be the only system with 8-bit 4 voice sound.

Yuck.

When you hear a 3DO, you'll see that won't cut it.

As for the real-time texture mapping, since there is no h/w in the 32 to do it, it'll load that 68020 up. Now... if that is the case, i'm curious as to the performance.

<it may still be pretty good.. demos on Falcons and A1200s do it all the time>

> The Jaguar needs something else.
>

Tell me about it!

>

I disagree. Mortal Kombat and Street Fighter ][ (in various forms)
consistently retails for $60-$90 (higher prices when first released) and
these titles sell out.

The average kid under the age of 16 probably doesn't buy their own games...
their parents do. :)

RH> hardisk
RH> equipped A1200. Crushes a Falcon for video.

Puke! If a programmerwants to SELL, he makes sure his program will work on the
*BASE* model! That's an A1200 without harddrive and 2 meg RAM!

RH> False. Atari lost its stronghold in Europe thanks to the Amiga 500.

Nope, due to nonexistant marketing.

RH> Well, is 'ATTACK' an ATARI magazine? That wouldn't surprise me.

It's a PC/Commodore magazine!

RH> The latest WOC here in the US had CD-32. Shows in Europe of the CD-32
RH> have been conducted showing the real-time Mpeg player module.

Not according to them.

RH> Are you making this up or is 'ATTACK' and ATARI magazine?

I could translate the whole article if you want to, but that would be a waste
of bandwidth. What they said was that on the ECTS-show in London, Commodore
wasn't anywhere to be found. (Read, no CD32s)

RH> AND BTW, most european games are released in the AMIGA *BEFORE*
RH> the PC. Ocean, Team 17, Illusions, Psygnosis, BullFrog... Dude, some
RH> of those companies don't even release on the ATARI's anymore!

Who talked about Atari's? Again, according to Attack the Amiga1200 has fallen
back compared to the PC:s. Most of the Amiga releases has already been out for
the PC a while, thus decreasing the marketvalue of them.

RH> Wake up and get a clue.

I *KNOW* my computer doesn't sell well, you apparently still think yours do...

Best solution is to buy your computer peice by piece, put it together
and buy os/2 in a year or so. (thats when IBM will not be paying
Micro-sloth for windoze code) Or you can buy Novel Dos 7.

>Most home computer users purchase machines that are compatible with
>what's at the office. (Just like when Apple years ago used to control

>children because that's the computer that was at school.)

THIS scares me! I personally don't want a Sparc 10 on my desk! :)

>We differ on this. Atari doesn't have the software that I want to run.
>Even if they did, I would be very hesitant to buy Atari hardware knowing
>that they might leave the computer market. (Pity those people who bought
>the XE game machines, and 2600s, and 7800s, and whatever else).

This is what I wanted to comment about. Why do you pitty those who
owned 2600, 7800 and Atari 8bit computers (the xe game system)? These were
some of the most advance consumer market.
1. The 2600 (VCS) released in 1977, supported till 1991. Has probably more
software than any other game system.
2. 7800. While not the most popular game system, there were 100 or so games
released for it. Came out 1984, and supported till 1991.
3. And the Atari 8 bit computers were the best 8 bit computers released. And
many of us are still using and enjoying it. It praticaly gets more use
than my 486

Rob Merritt

Opinions are my own

>is pretty much in that shape too for that matter :-| ).

(This is turning out to be a fun-filled, informative thread. Glad
you joined in: no need to apologize!)

Since I've actually seen the Atari booth and demonstration personnel
at a computer show that they hadn't attended before, I have seen an
increase in Falcon marketing. While it certainly isn't overwhelming
(due to a lack of resources), they *are* increasing their marketing.

And that's a good thing.

> I hope the Jaguar takes off, because it surely looks cool.

I drool over the one at Computer Plus every weekend. One of these
days I'll be able to take it home with me (drool marks and all!).

Ah, so this pretty much invalids a lot of your arguments. What happened
to your 'Europe CD-32 software support doesn't count' kind of thinking?

|> Especially not the professional packages. A
|> lot of smaller houses over here (noticeably CodeHead and Gribnif) began
|> importing high-powered apps from Europe (check out Avant Vector) until then.

And you think this doesn't happen with the Amiga market?
This posting of yours is very funny Flip. You disregard the importance
of CD-32 being supported by a lot of software development in Europe, yet
you don't mind that the ST is in exactly particularly that boat.

|> >|> 1) it's not just a game machine. CD^32 and Jag both are just game boxes.

Well, ok, I could be wrong by the way they called it, but the majority
'on the work' titles that I have read about are GAMES.

|> (in fact, I've used both the Kodak Photo-CD and the CD-I from Phillips for
|> Photo-Cd purposes and, believe it or not, the 3DO has more flexible zoom
|> and rotation possibilities than either!)

CD-I seems really dead. I don't see anybody wanting that any longer...

|> than its percieved value.

Well Flip, when you compare an $80 Super Nintendo or Sega I don't think
I am not blowing it out of proportion. We'll see.

|> >|> 3) they have over 300 companies supporting them.
|> >
|> > Really? Just because people have signed up, doesn't mean they got

|> about 20-25 DEMOS on CD-ROM of titles in development.

20-25 DEMOS != 300 companies! Not even necessarily 20-25 companies as
some demos belong to just one company!

|> Even if 200 of them are playing wait-n-see, they are signed up.

Which doesn't necesarily mean a thing! Same happened with CDTV originally
and guess what happened later :-|

|>
|> 3DO will likewise persevere for at least a few years.

OH, I don't doubt 3DO will be around. All I'm saying is that its higher
price tag will give a clear chance to ATARI and C=. IF ATARI doesn't screw
up and gets good support, I might see it as actually kicking 3DO.

OF course, that's a BIIIIIIIIIIIIIIG IIIIIIIIIIIIIFFFF

|> >|> Jaguar is a threat to both, but... they lack a major title to hook the public.

|> <if so, tell me what the probelm with it is>

You got a point. I haven't. Looks pretty much like a typical
shoot-em up. I mean, Flip, looks good, but what I am saying is that
it looks too much like a 'me too' kind of thing.

With a Jaguar you really need something to convince everybody
how good the system is. Like Crash N' Burn for 3DO :-)

BUT YOU GOT A POINT! I HAVEN'T PLAYED IT SO I'LL SHUT UP! :-)

[one line accidentaly deleted]

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
/
ah, in New York and San Francisco ONLY with a top selling number of
50,000 units, as ATARI has said.

|> and the
|> 3DO will have far more recognition and the CD^32 will look like a blatant
|> copycat attempt by C= on this side of the Atlantic IF it doesn't offer some
|> strong titles to back it up.

I am not really worried about CD-32 title's. Seeing Psygnosis developing
for it can gurantee a killer title. My concern is that mysterious

force called marketting. C= s*cks in that area :-|

|> Right now, Atari is just beginning to recieve some good press... I heard
|> today that in a game mag they have on the cover a 3DO being chased by a Jag
|> (can anyone give me the name of it? I'll try to dig this up myself... i
|> had the misfortunate of overhearing this while playing on the 3DO and trying
|> to NOT get killed in Crash 'N Burn :) )

That looks really funny! I'll like to see it!

Yep, the Jaguar is picking up hype. That looks really good for ATARI.
I really hope ATARI doesn't screw it up, 'cause I admit the Jaguar looks
really cool.

|> >|> and is (like Jag) "just a game machine". The

|> >card.
|> >
|> *cynic mode on*
|> Are we supposed to believe they are gonna ship it? How long have they had
|> their AT&T 3210 DSP card "shown" or "ready" for the Amiga to bring it up
|> with the Falcon and DSPed Macs?
|> *cynic mode off*

Yes, you know why?

First: C= has never shown their DSP card. They never said they had it ready.

Second: The C= mpeg player is based on C-cube chips, which will be used
on other systems too.

Third: C=, CD-I guys, and a couple other influenced in the Video CD standard.

|>
|> Well, Video CD is nice. But this is nothing CD-I and 3DO won't be able to
|> do. And all of them have to offer the FMV as an addo-on board.

Exactly. The Video CD standard would be played by CD-I and 3DO with an
add on board (on *BOTH* cases). But CD-32 is the lower cost unit allowing
that, and CD-32 kicks' CD-I butt pretty much.

|>
|> (which costs)
|>
|>
|> >|> Could change real quick based on units for sale.
|> >
|> > Yep. What I expect of 3DO: A huge yuppie-latest-thing-frenzy buy,

|>

|>
|> That may be the case. If so, the only beneficiaries would be Atari (who is
|> generating demand for Jag, dealers in CA got some test-units, and seem very
|> impressed on the phone), and Sega (who has a big-budget item in their CD unit
|> which could stay profitable a bit longer if 3DO fizzles a bit).

IF C= could put some adds against the MegaCD, I see the Sega CD in
real problems. Now, again, that's also a BIIIIIIIIG IIIIIIIIIIIIIFFFF :-)

|> >important. Hilarious.
|> >
|>
|>
|> No, I was simply saying that if price WAS important... which it is... the
|> Jaguar benefits more than the CD^32 in the comparison against 3DO.

But you are comparing CD-32 against the 3DO, you didn't mentioned the Jaguar.
On the CD-32's good side, is the double-speed CD-ROM at that price.

|>
|> (at least the Panasonic one)
|>
|> I still haven't gotten the price on the AT&T 3DO.

I can $$$IMAGINE$$$ :-)

|>
|>
|> > The Jaguar on one end won't have a CD. This could be good.... or bad.
|> >Even a CD-32 could do better games against a cartridge based Jaguar until
|> >you put a CD-ROM to the Jaguar.
|> >
|>
|>
|> Sure, right. Does the CD^32 display 16.8 million colors at once? Or is it
|> using HAM8 to fake it with 200,000+ plus? uh huh.

Fake. He he. How much is 320x200 Flip? Answer=64,000.

How much is 640x400 Flip? Answer=256,000.

How much colors can Ham8 display: Answer: 262,144 (Actually, more).

I AM WILLING TO PLACE A BET WITH YOU, ON TAKING SOMEONE ON THE STREET
AND SHOW A VIDEO OUTPUT IN HAM8 VS A 24-BIT SCREEN TO SEE IF THEY CAN SEE
THE DIFFERENCE!

|> And I'm sure it has a
|> nice high rez display and all the real-time texture mapping in hardware for
|> speed.

Nice high-rez-> yes. Real-time texture mapping-> Nope. It has a new coprocessor
that helps in that, but definitively not like the Jaguar.

|> Yep, that CD^32 is a killer box... they basically take an A1200, which is an
|> ok computer, and try to make it a game machine against boxes with 64-bit
|> graphics and Blitter chips (remember, A1200 has a 16-bit blitter!) and
|> sell it for $200 more with a CD-ROM.

It's not $200 more.

|> Basically, the hardware in the CD^32 in no way is superior to the Jaguar.
|> A cartridge based Jag is capable of whipping it soundly.

Not necessarily, which is my point. The CD-ROM memory can really help
in this area. If you are going to tell me otherwise, you haven't tried
developing games then, or you haven't dealt with graphics.

|>
|> (for half the price)

Read above.

|> > BTW, the price difference is bigger than $150 (CD-32 and the Sanyo).
|> >And when the Sanyo will come out?
|> >
|> >|> 2) the Jag has comparable, if not superior, technology in its chipset.

|> >too. Jurassic park for the CD-32 will do 3D/Wolfstein/Alien vs Predator
|> >type things.
|> >
|>
|>
|> Jurassic Park on the 3DO will be better, though.

|> Remember, if they stick to A1200 chip specs, they'll be the only system
|> with 8-bit 4 voice sound.
|>
|> Yuck.

Ah, but they have CD-quality music.... from the Cd- you know.
The games that come with it use that.

|>
|> When you hear a 3DO, you'll see that won't cut it.

Well, read above. It wouldn't surprise me that 3DO might
do the same thing for some music too.

|> As for the real-time texture mapping, since there is no h/w in the 32 to do
|> it, it'll load that 68020 up. Now... if that is the case, i'm curious as
|> to the performance.

It has a new coprocessor that helps, although not really that much (in my
opinion).

|>
|> <it may still be pretty good.. demos on Falcons and A1200s do it all the time>

Having the CD-ROM to draw graphics from surely helps.

|> > The Jaguar needs something else.
|> >
|>
|> Tell me about it!

It needs SOFTWARE. And good marketing :-) Although the hype is starting
to build up which is good.

FLIP: I know the Jaguar is very superior from what I have read so far,
no doubt about it. Just telling you that the CD-32 can pullout very good games
too, thanks to the CD-ROM.

Now, I would admit I would like the Jaguar to succeed to a certain extent.
It's the same reasons why I wanted an Amiga to succeed-> technologically awesome.

>that they're including MORE hardware -> 3DO compliant.

You forgot the smiley, didn't you? Your conclusion leaves a lot to desire,
and is false (not to mention ridiculous in general). Here is the reason why:
In order to be fully "3DO compliant", this CD box would need to have every
bit of hardware that a normal 3DO box has, which is 1M Video RAM, 2M GP RAM,
an ARM CPU, the 3DO graphic ASIC's, DMA controller, CD mechanism, CD
controller, 1M ROM, and more. None of this is for free, and the resulting
product would end up in the same price range as a standard 3DO player.

Even you must realize this is not going to happen?

>Puke! If a programmerwants to SELL, he makes sure his program will work on the
>*BASE* model! That's an A1200 without harddrive and 2 meg RAM!

You never cease to amaze me. Let me tell you one thing: there are tons
of software packages for the Amiga that require more than 2 meg RAM, and
they sure as hell sell anyway. We're not talking arcade-games here, we're
talking about video software, and video is among the most memory-demanding
applications you can come up with. Why do you think several companies
produce 128MB expansion boards for Amigas ?? Do you think teenagers making
cheesy eurodemos use them to keep all their megak00l 0-day warez on a
RAMDISK? No.

>RH> False. Atari lost its stronghold in Europe thanks to the Amiga 500.

>Nope, due to nonexistant marketing.

... and due to technological inferiority, which meant disappointed Atarians
sold their machines to some poor sod and bought an Amiga instead. Atari
could not compete.

>RH> The latest WOC here in the US had CD-32. Shows in Europe of the CD-32
>RH> have been conducted showing the real-time Mpeg player module.

Interesting. My boss was there, and he's got a different story for you:
Commodore was there.

>RH> AND BTW, most european games are released in the AMIGA *BEFORE*
>RH> the PC. Ocean, Team 17, Illusions, Psygnosis, BullFrog... Dude, some

>the PC a while, thus decreasing the marketvalue of them.

You quote this cheesy mag as if it was some kind of authoritive source
of definite information. To me they seem like incompetent idiots. Just
have a look at that last sentence; if Attack wrote that I'd say they're
completely clueless. How can the fact that a game has been out for a
while on another format "decrease the marketvalue of them"?

The fact still remains, european games are released on the Amiga first,
and Amiga games outsell PC games by far according to ELSPA, the European
Leisure Software Producer Association.

>RH> Wake up and get a clue.

>I *KNOW* my computer doesn't sell well, you apparently still think yours do...

And it does. Commodore cannot keep up with demand, even. It's difficult to
sell more than you produce, isn't it?

On your computer? Is your A1200 a CD^32?

:)

Actually, if the CD^32 comes with a floppy drive standard, that would make its
software base pretty large. However, the games on the Amiga are behind Genesis
and SNES levels for action games.

<so i doubt it'd look good against a 3DO or Jag>

You don't remember it because ever since I've advocated the Falcon as a nice
machine, it'd been shipping. :)

<so i never got a chance to say it was vapor to you :) >

"It is out"

followed by:

"It will be here"

Sure. Right. Why is it in Europe and not here? There are plenty of nice
toys for the ST and Falcon series in Germany and other parts of Europe, but
they are vapor unless I can get them here. Well, why should I deal with
Commodore's vapor trail? Do I look like I need another machine that is
well supported overseas and dead over here? :)

>
> Ah, so this pretty much invalids a lot of your arguments. What happened
>to your 'Europe CD-32 software support doesn't count' kind of thinking?
>

You misunderstood. What I was saying was that the ST didn't have any
European software getting imported where I live in America until around
1990.. maybe as early as 1989.

In 1988, all of that German software did me absolutely NO GOOD until I could
buy it off the store shelf or mail order it.

>
> And you think this doesn't happen with the Amiga market?
>This posting of yours is very funny Flip. You disregard the importance
>of CD-32 being supported by a lot of software development in Europe, yet
>you don't mind that the ST is in exactly particularly that boat.
>

Well, it is funny until you consider that the ST stuff from Europe has finally
found its way here. :) The CD^32 is not here. And won't be here until
next January. And noone has released software over here yet (probably because
the machine itself doesn't exist in America, does it?)....

> Well, ok, I could be wrong by the way they called it, but the majority

>
> CD-I seems really dead. I don't see anybody wanting that any longer...

CD-I is on sale in Circuit City. CD^32 and Jag are not. So they have placed
their product on the altar of the consumer and are praying we accept it.

I think it will die, but it will have some life for a bit.. CD-I will be
pioneering the FMV stuff (Phillips played a major role in it...). I expect
it to be like Sony's Beta... it'll be nice for a while, but when it dies, the
parent company will be equally at home on another standard.

>some demos belong to just one company!
>

That's true. But the presence of the developers is seen on the product
which is shipping (3DO). Right now, Commodore has a *list* and Atari has
a *list*, but on this side of the Atlantic, that's all.

And if the CD^32 is so good and is shipping with product, go buy one and
do a review. I did my part... I got my hands on a production 3DO and
played it to death. :)

>|> Even if 200 of them are playing wait-n-see, they are signed up.
>
> Which doesn't necesarily mean a thing! Same happened with CDTV originally
>and guess what happened later :-|
>

Which may make a darn good case (tm) for the CD^32 not being taken seriously.

(heck, Atari had to pull a 64-bit system out to get rid of the negative
image they got for the half-assed effort they did marketing the 7800 and
the XEGS... (which is very similar to the CD^32 in concept.. a computer
company decides to repackage their computer as a game machine... and...
it flops!)

>

True. But given that, even, they have 3 months of free marketing from putting
the machine out. Look at the hype in the game magazines being given to the
Jag now. It will balloon. Atari is foolish, though, to not try to push it
THIS Xmas, but the hardware should be valid in a year.

I give Atari about a 60% chance of makign the Jag succeed well enough to
turn a serious profit. I think at worse, they'll achieve the same market
penetration as the TurboGrafx-16.

Wait-a-cotton-pickin'-second!

When I was goign through that whole long Falcon vs. A1200 BS thread a few
months ago, I saw people pulling stuf about this AT&T 3210 DSP out their
butts every 5 seconds. One moron posted the entire tech specs! And Greg
Block (no flame intended) defended the A1200 and 4000 series partially by
hinging his defense of it going DSP-less by saying it would be a future
add-on.

Now, somewhere in the midst of this, it appeared everyone who was advocating
it believed it would ship yesterday!

>
> Second: The C= mpeg player is based on C-cube chips, which will be used

I totally agree. CD^32 would be vastly superior to the Sega CD. As far as
power goes, the CD^32 would blow everything EXCEPT the Jag and 3DO.

>AND SHOW A VIDEO OUTPUT IN HAM8 VS A 24-BIT SCREEN TO SEE IF THEY CAN SEE
>THE DIFFERENCE!
>

It's not how many colors are onscreen at once, it is how smooth the transition
is between colors on the screen.

(for example, look at the difference between an old ST with a 512 color
palette doing a 320x200x16 image and an STe with the 4096 color palette)

If you hook them up to a stock TV, maybe no one will notice. But if you
hook it up to a hi-rez monitor (say, a 27" Mitsubishi) you might.

Disclaimer: More colors != good game. But the Jag has very nice h/w.

>|> And I'm sure it has a

>
> It's not $200 more.
>

Jaguar is $200.
CD^32 is $400.

$400 - $200 = $200.

In marketing terms:

"For twice as much money, you could buy a CD^32!"

:)

Have you gotten the specs on how large a Jaguar cartridge can be, either
compressed or uncompressed? It's not shabby.

>
> Ah, but they have CD-quality music.... from the Cd- you know.
>The games that come with it use that.
>

Think about this:

If the CD is playing back music, it CAN'T LOAD MORE GAME DATA AT THE SAME TIME!

The reverse of this is:

If the CD is playing the music, the system WASTES RAM ON SOUND!

Howver, as I remember some people who advocated teh Amiga saying, playing back a song from memory as a single sample is wasteful. While the Jag or 3DO are using something akin to the .MOD file method (sampling the instruments and playing back those instruments via a sound chip), the CD^32 either gives you 4 voices of 8-bit sound or uses the CD-ROM. (actually, it could do both.. 4 voices for game sounds, CD-sound for music) The catch is, when it comes time to load the next level, CD music goes off.

>|>
>|> When you hear a 3DO, you'll see that won't cut it.
>
> Well, read above. It wouldn't surprise me that 3DO might
>do the same thing for some music too.
>

Actually it doesn't... music keeps on playin while you pop the discs in and out, etc. etc...

<so i guess you won't be surprised! :) >

: Yup, the rumour is that the price of the Jag-CD would RISE, that would imply
: that they're including MORE hardware -> 3DO compliant.

Why on earth would it be a Jag-3DO-CD. What features of the Jag
are they going to use? So this 3DO compliant CD unit is virtually
going to be a 3DO box with ARM processor, ASIC's, ROMS (operating
system). Heck, by the time Atari has added all that stuff they'll
be hard pressed to compete against the other big manufacturers
that build the units themselves (and do not pay outsiders to
build them).

# 2275. Jag's video-RAM

Newsgroup: comp.sys.atari.advocacy
Date: 1993-10-05 11:12:27 UTC
From: kesseler@arthur.crpht.lu
Message-ID: <KESSELER.93Oct5121227@arthur.crpht.lu>
Source record: 20962

Hi,

Has anyone an idea how the video display of the Jaguar works and where it has
the video-RAM. Looking at the block-diagram I get this:

DRAM --> DRAM Processor --> 64bit bus --> Object Processor --> video

And isn't the object processor doing the texture mapping and gouraud shading?
Is it doing that on the fly? Is there no real video-memory? Do you give the
object processor the descriptions of the objects and it maps/draws them
as fast as the electron beam moves, so needing NO video RAM at all???
If it works like that, it's amazing and technically GREAT. If it does not
i wonder how the games can work if 1,5 Meg of the 2Meg are used for the
videoRAM.

Any ideas, infos?

Georges.

>Shadow of the Beast?
>Does that run on an A1200?

No, but beast 2 and (i think) Beast 3 DO.

Out of curiousity, just how compatible is ST Games software with the Falcon? I would expect OS legal stuff to be 90 percent + compatible, but I think games may tell a different story as they tend to hit the hardware direct. I think CBM did a great job engineering the AGA chipset for backward compatibility. All new Amiga games will run perfectly on the A1200 (Its so nice to actually have lots of new software, isn`t it Falcon owners?) and most of the old stuff does too. A lot of the stuff that doesn`t just needs the ECS emulation selected on the boot menu and it runs fine. Even better, old software re-released as budget is now fixed the run on the A1200 out of the box (it was usually the copy-protection causing the problems)

>Exactly. Despite selling more units, the Amiga doesn't do what I (and some
>other people) need a computer for. In my case it is MIDI. Lord knows, after
>a day on my new job (programming an app under OS/2 2.1 with multithreading...)

You may want to do MIDI, the majority of people want a computer
to do games on and to learn how to program, maybe to do a little
word processing and database too. In Europe, the Amiga is supreme
for this. In the states, where the market is more superficial and
goes by who has the biggest advertising budget, Games consoles have
cut this market away from home computers from the gaming point of
view, and the PC has mopped up the rest.

Here at least, the Amiga is still strong and viable. Most of the
games console games and PC games are converted for it, and there are
still lots of new games coming out on Amiga first. The ST market on
the other hand is now virtually non-existant.

>I realize the PC has blown the Amiga and ST completely away. There is no
>competition for general purpose or most hobbyist computing.

Both the Amiga and ST blow away the PC for hobbyist conmputing.
It`s the business arena where the PC has triumphed. Its still a shit
home computer. In America, market forces have pushed the Amiga and
ST into obscurity, but here there is still a viable home market,
just like there used to be in the states (remember the Atari 8-bits,
C64, TRS-80 days?)

>So the Amiga has more potential for video, and Falcon for MIDI and audio...

Yes, but the Amiga also has much better games potential and more powerful
machines available for high end work - you can`t even buy a Falcon that runs
faster than 16Mhz. The Amiga has much more in the way of expandibility and
is much, much cheaper making it a good starter machine.

>All this means is... despite selling pletny of units... it's
>not doing much better compared to the "big boys".

In Europe, its doing very well thank you.

>So you're saying it is okay to cripple a machine in the name of cheapness?
>Hmmmm. :) I should have used that in defense of the Falcon's CPU->RAM
>16-bit bus argument...

The A1200 is only crippled in the case of coming with chip ram only as standard. This slows the machine down, but is easily remidied. If you don`t need a machine with more than 2 megs, you wont notice the loss of speed due to chipram only. (Its still 2x faster than the A500 at a lower price, 4.5x with fastram)

You could hardly call the Falcon `cheap`. The expense of buying one is the major reason why it has flopped.

>Is it just coincidence, or am I the only one who has noticed when the Falcon
>whips the A1200 (which I think is a very nice machine), Amiga owners whip
>the A4000/40 out their butts? :) I mean, no one in this discussion even
>seems to HAVE one. :)

I think its fair to compare like priced machines. A F030 with 4 megs and a 65 meg hard drive is competing at that price level with an A4000/030. Thats a machine which should deliver over 3 times the raw processing power of the F030 and has proper expansion slots.
Not to mention the fact that you can`t even get an 040 based Falcon at any price.

Hey! **THE JAGUAR DOESN`T EXIST YET**

Until there are Jaguars FOR SALE in the shops (at least somewhere in
the world) then I would suggest you hold back from citing this or
that as being advantages for the Jaguar.

Isn`t the Jaguar supposed to be released at the end of this month?
Lets see if it comes out on time. Lets see if it lives up to
promises.

I must admit to be being impressed that the 3DO machines seem to
be shipping on time. All reports that I had seen in consumer
electronic mags would have seemed to indicate the contrary. Is the
release version complete? ie are there any noticable bugs or
kludges? When can we expect to see them widely available?

Anyway, here the CD32 has very much established itself. All the
big consumer electronics and videogame retailers are advertising it
(not much from C= tho` - no surprises there!). Demand seems to be
high and the whole thing seems set to succeed. Machines are HERE,
they WORK and they are CHEAP. What`s more, although there is no
great specific CD software yet, theres plenty of good standard Amiga
software shovelled onto CD which should keep the punters happy while
they wait for the real CD games.

I don`t see 3DO competing much. The market for CD machines at the
moment is for GAMES and 700 pounds is too much for a games machine.
I don`t think the time is right for multimedia boxes in the home yet
- although it will happen one day.

cmedley@wam.umd.edu ('Flip') writes...

>Also, as far as I am concerned, the CD^32 is vapor. Why? It isn't in
>America. When Atari releases products in Europe, I call them vapor until
>they exist here. Why should I cut Commodore any slack on this?

The CD32 exists. It is in a finished production form. It is widely
available in Europe NOW.

The Jaguar DOESN`T yet exist in anything other than prototype form. It
isnt on sale, there is no sigh of any software for it. We dont know for sure
how much it will cost. Noone even seems to agree whether it uses a 68000 or
a 64-bit RISC chip as its CPU even - and it supposed to go on sale at the
end of this month!!!!!

Still no sign of the 3DO here, although I`m prepared to accept that it
exists from your friends experience. I wonder will there be problems getting
a PAL version for Europe - possibly delaying it for a while here.

I couldnt care less whether the CD32 goes on sale in the US or not as
long as it gets good software support here which is what it seems to be
getting. It will ensure the survival of Amiga technology in an ever more
competitive market. As i said before, I dont see it competing with 3DO. Here
3DO is supposed to cost 750 UKP and I can buy a CD32 *NOW* for 265 UKP mail
order or 300 UKP in most electronics retailers. I just can`t see the public
taking to 3DO.

Is the 3DO FMV system compliant with MPEG 1? I had heard that they use a
proprietary system. Also, can you hook up a keyboard to 3DO and program on
it? If neither of these points are true then its potential market is
immediately much smaller than the CD32s.

Kids will buy CD32s to play games on since they are cheap and have great
games (by virtue of Amiga heritage). THATS how CD systems will get into the
home. I don`t see a great mass of consumers crying out for multimedia boxes
in their living rooms. Thats why C= bombed with the CDTV, and Phillips with
the CDi - they were aimed at a non-existant market.

The Jag MIGHT succeed IF it is as good as Atari advocates hype it, IF it
is available at the quoted prices ($300 and $400) and IF it has good
software support. Given Ataris past catalogue of flops (ST, Lynx and Falcon)
do you REALLY think they can beat the opposition with this one?

Please email a copy of any replies as I`m not around on the net much these days.

>software base pretty large. However, the games on the Amiga are behind Genesis
>and SNES levels for action games.

Bollocks! Don`t believe the hype. The fact is that games on the Amiga are easily up to Sega and Nintendo standards. With the exception of a couple of games on the SNES which take advantage of the unique hardware, there is nothing on these machines that isnt done equally well or better on Amiga. The Amiga also has a wider range of software - plenty of flight sims and RPG/strategy games which simply dont appear on consoles. (except for the occasional, poor conversion). All in all, the Amiga has a wider range of cheaper, better software than any console. Oh, and you can program the thing too and learn about computers on it.

All the consoles have is big bucks promotion so they can rip off gullible kids.

And all this is with standard ECS 16-bit games. Once we see proper 32 bit AGA games we can expect to see the A1200 and CD32 wipe the floor quality wise.

The ONLY game I have seen on the SNES that couldnt be done as well on an A1200 is Super Mario Kart. Even then, I could be proven wrong...

BTW How many 3DO games can we expect to see in the next YEAR?

I dont think its being used for much at the moment. Manipulating
digital sound (the reason why its there) and decoding JPEGs (nice).
I can`t see it ever being used for games, except for maybe some PD
stuff and that ain`t any reason for anyone to buy a Falcon.

I guess this guy has not seen the SPEEDER2 demo :-).....
.....and of course it is going to be used in games; especially where fast
calculations are necessary. The only time it is going to be used for sound
is if you want any special processing done on your sounds (ie echo etc.).
Otherwise you can use it for whatever you wish.

Commodore where backing CD32 to the hilt at Live'93 (UK consumer electronics show) with many CD32's on display and available for use by the general public showing a variety of games (all excelent) as well as MPEG FMV and CDXL. ( the clips from the Jurasic park CD I saw had actual footage from the film before jumping into parts of the game).

Now where were 3D0 and Atari ..... nowhere to be seen.

Or that means that it will just rise. Boy, are you gullible.
I see, now 3DO's cool because of some imagined posibility that the Jaguar
will be 3DO compliant.

I can imagine-> what would you say when the Jaguar CD comes out,
it isn't compliant and 3DO competes with the Jaguar.

What will you say then? Gee, the Jaguar is better so there's no
need for the compatability?

Richard, this is by far the silliest posting you have dared to post.
Jaguar CD being 3DO compliant....

Allen, again, ATARI could be just talking about 1 bit pixels.
Well the same goes for 3DO I admit, but the thing is that if that's true
(for ATARI and not for 3DO), the 3DO is better. I admit is is speculation,
but both companies could have done the same.

And still, the end result could be pretty much the same, as long as
you can update the whole screen.

That depends. If you talk about action games, that's not
true for games like ArmourGeddon or the Beast Series, Leander, etc.

|>
|> <so i doubt it'd look good against a 3DO or Jag>

Read above.

|> >|> Also, as far as I am concerned, the CD^32 is vapor. Why? It isn't in
|> >|> America. When Atari releases products in Europe, I call them vapor until

|> Commodore's vapor trail? Do I look like I need another machine that is
^^^^^^^^^^^^^^^^^^^^^^^^
|> well supported overseas and dead over here? :)

Because Commodore, UNLIKE ATARI, usually sets a date when things
are going to be available in the US and usually they go ahead and do it.
This happened with the A3000, A4000, A1200, A600.

ATARI, well...

Although I do believe in ATARI's Jaguar release, as a big company
I work for will manufacture it :-)

|> > Ah, so this pretty much invalids a lot of your arguments. What happened

|> 1990.. maybe as early as 1989.
|>
|> In 1988, all of that German software did me absolutely NO GOOD until I could
|> buy it off the store shelf or mail order it.

Well, you misundertood too. You used this argument as a basis for saying
that the CD-32 europe software won't be important implying it wouldn't
be imported. Wrong, Wrong, Wrong. You can always get Europe Amiga
games. Same case with CD-32.

|> > And you think this doesn't happen with the Amiga market?
|> >This posting of yours is very funny Flip. You disregard the importance

|> >you don't mind that the ST is in exactly particularly that boat.
|> >
|>
|>
|> Well, it is funny until you consider that the ST stuff from Europe has finally
|> found its way here. :)

It continues to be funny since the Amiga europe software always finds
its way here pretty darn quick.

|> The CD^32 is not here. And won't be here until
|> next January. And noone has released software over here yet (probably because
|> the machine itself doesn't exist in America, does it?)....

But when it arrives on January (which could actually even arrive before
that), a lot of software already running for it would be ready. This is
my point.

|> > Well, ok, I could be wrong by the way they called it, but the majority
|> >'on the work' titles that I have read about are GAMES.
|>
|> And what are you reading? Game magazines? :)

Game Magazines, Time and a magazine called 'Wired' which is not a game
magazine.

|> >|> (in fact, I've used both the Kodak Photo-CD and the CD-I from Phillips for

|>
|> CD-I is on sale in Circuit City. CD^32 and Jag are not. So they have placed
|> their product on the altar of the consumer and are praying we accept it.

It's not selling. Which is why 3DO is also betting heavy on games.
The multimedia idea so far doesn't sell, particularly at a high price.

|> I think it will die, but it will have some life for a bit.. CD-I will be
|> pioneering the FMV stuff (Phillips played a major role in it...). I expect
|> it to be like Sony's Beta... it'll be nice for a while, but when it dies, the
|> parent company will be equally at home on another standard.

The CD-32 will precisely pioneer this format. As I said, the Video CD
standard was finally established by a couple of companies, Phillips *AND*
Commodore included.

|> >|> Once again, you have not seen the machine. On the sample disk alone, we see

|> That's true. But the presence of the developers is seen on the product
|> which is shipping (3DO). Right now, Commodore has a *list* and Atari has
|> a *list*, but on this side of the Atlantic, that's all.

False. Commodore is shipping some of the games.

|> And if the CD^32 is so good and is shipping with product, go buy one and
|> do a review. I did my part... I got my hands on a production 3DO and
|> played it to death. :)

Flip, I am not saying that CD-32 is the end all. I admit that both
the 3DO and the Jaguar have better graphics hardware. The part where
I see CD-32 on a chance is that it will be one of the very early to
support Video CD, comes with a double speed CD-ROM at an affordable
price, Kick's the Genesis MegaCD butt, and has good software developer
support.

Having the double speed CD-ROM at the price it has it surely helps.
I can imagine pretty excellent awesome adventure games in that thing.

|> >|> Even if 200 of them are playing wait-n-see, they are signed up.

|> >and guess what happened later :-|
|> >
|>
|> Which may make a darn good case (tm) for the CD^32 not being taken seriously.

True and not true. I would take seriously Psygnosis, Ocean and others
because they have released a lot of Amiga games in the past * AND * they
have shown demos of their working titles.

|> (heck, Atari had to pull a 64-bit system out to get rid of the negative
|> image they got for the half-assed effort they did marketing the 7800 and
|> the XEGS... (which is very similar to the CD^32 in concept.. a computer
|> company decides to repackage their computer as a game machine... and...
|> it flops!)

Well, there's a big difference. ATARI did a VERY LOUSY JOB supporting
the XEGS and add to that that the NINTENDO's hardware that was around
was actually better for games.

The CD-32 on the other hand has pretty decent hardware (better than the
S-NES for a lot of things and better than the Genesis on almost everything).

Developing for the CD-32 is relatively easy, as you can use all the
powerfull software utilities available for the Amiga.

|> >|> In January of 1994 the Jaguar would have been on sale for 3 months

|> THIS Xmas, but the hardware should be valid in a year.

True, it is gaining hype and that looks really good for ATARI. I hope
they don't screw up because I like the system too. In fact, I might
end up buying one.

|> >|> Right now, Atari is just beginning to recieve some good press... I heard

Wow! Now that's being objective on your behalf Flip.... Actually,
the way the hardware looks like I would give it more, but then we'll have
to see how much ATARI has changed.

|> >|> *cynic mode on*

|> Block (no flame intended) defended the A1200 and 4000 series partially by

|> hinging his defense of it going DSP-less by saying it would be a future
|> add-on.

Well, the specs for the AT&T DSP exists, becuase the chip exists. But
C= has never shown this card. I never *EVER* said something bad about
the Falcon's having a DSP. The DSP 3210 is better than the Motorola 56001,
but that's another story. Now, C= really expected to have the card out
last summer, things changed and is one C= screw-up I admit. But I also
understand their limited resources at this point.

|> Now, somewhere in the midst of this, it appeared everyone who was advocating
|> it believed it would ship yesterday!

Well, that WASN'T ME! And what about the Falcon here? People advocating
a machine that didn't exist for *MONTHS*.

|> > Second: The C= mpeg player is based on C-cube chips, which will be used
|> > on other systems too.
|>
|> Including 3DO and CD-I, i think. Are there two competing standards for
|> full-motion video?

No. 3DO and CD-I will probably use the C-cube, but there's only ONE
standard (Finally!) of Video CD.

|> > IF C= could put some adds against the MegaCD, I see the Sega CD in

|> It's not how many colors are onscreen at once, it is how smooth the transition
|> is between colors on the screen.

Well, the CD-32 has a 24-bit palette so the transition would be as smooth
as the Jaguar's.

|> (for example, look at the difference between an old ST with a 512 color
|> palette doing a 320x200x16 image and an STe with the 4096 color palette)

Spare me the class on colors and color palette. I do video work and I know
darn well the differences. Ham8 looks indistinguishable from 24-bits.

|> If you hook them up to a stock TV, maybe no one will notice. But if you
|> hook it up to a hi-rez monitor (say, a 27" Mitsubishi) you might.

Well, that sez it. 27'' Mitsubishi. On that you'll notice that graphics
don't look good even at high-res compared to a normal monitor.
Also, I guess everybody will have a 27'' Mitsubishi, right?

|>
|> Disclaimer: More colors != good game. But the Jag has very nice h/w.

I agree.

|> >
|>
|>
|> Have you gotten the specs on how large a Jaguar cartridge can be, either

|> compressed or uncompressed? It's not shabby.

Uncompressed is 6 megabytes. That's lame when you have CD-quality audio
and 24-bit graphics.

Compressed it goes up to 400 megabits, with is 80 megabytes... but again
this is a 'up to'. If you know well, 'up to' means:

"in the best theoretical case" which isn't an average situation. Now,
if you can compress stuff on the cartridge, don't you think you can't do
the same for a CD? Say even a lame fast compression, so a CD with 600 megs
goes up by a factor 3 = 1800 megs. 1800 megs vs 400 megs.. .hmmm....

|> > Ah, but they have CD-quality music.... from the Cd- you know.
|> >The games that come with it use that.
|>
|> Think about this:
|>
|> If the CD is playing back music, it CAN'T LOAD MORE GAME DATA AT THE SAME
|> TIME!

True. But you can play music at the same time you have the game running.
After all, the CD-32 has 2 megs on board.

|> The reverse of this is:
|>
|> If the CD is playing the music, the system WASTES RAM ON SOUND!

Why? why is that? The music comes from the CD direct.. I don't see
how this wastes RAM.

|> Howver, as I remember some people who advocated teh Amiga saying, playing
|> back a song from memory as a single sample is wasteful. While the
|> Jag or 3DO are using something akin to the .MOD file method (sampling
|> the instruments and playing back those instruments via a sound chip),
|> the CD^32 either gives you 4 voices of 8-bit sound or uses the CD-ROM.
|> (actually, it could do both.. 4 voices for game sounds, CD-sound for music)
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
Ah, I'm glad you came back to reality on your own.... My flamethrower
almost went on fire :-)

|> The catch is, when it comes time to load the next level, CD music goes off.

AND? How manygames load a next level without pausing the music?
After all, you can start playing a short music using the Amiga's sound while
the CD load the next data.

Well, it is pretty good. There are a number of things that don't run
well though until you run a program that offers a high level of ST
backwards compatibility, but then they work fine.

I dont think its being used for much at the moment. Manipulating
digital sound (the reason why its there) and decoding JPEGs (nice).
I can`t see it ever being used for games, except for maybe some PD
stuff and that ain`t any reason for anyone to buy a Falcon.

Gavan

I know of at least one really nice looking game called Space Junk
coming out, that uses the DSP I believe. This is a big game too, the
demo version is like 7 meg on disk!!

As far as I know, speeder 2 doesnt use the DSP for the SNES-mode7 style
effect, but it uses it for the Modfile only.

It WILL be used for 3D and polygon calculations.

And some crazy guys in germany published a listing in ST-computer how to
program the DSP as video-chip (320x200 monochrome) :-)

It is entirely possible for Atari to do this since 3D0 is just an
open standard that allows anybody who wants to produce the hardware the
opportunity, plus some of the more difficult I/O (like CD-ROM access) is
probably handled through OS calls. However, I think that this would be the
absolute worst thing Atari could do to the Jaguar. It would cause the 3rd
parties to only produce 3D0 CD's since that would also cover the Jaguar case
and we would never see Jaguar specific CD's (which would be better than 3D0
CD's because of the Jaguar's superior hardware). I HOPE THIS IS JUST A WILD
RUMOR AND ATARI IS SMART ENOUGH TO NOT DO THIS TO THE JAGUAR.
What might be a good thing is for Atari to make their CD-ROM drive
and Jaguar capable of being a 3D0 but let a 3rd party make a cartridge to
actually do it.

Gee, by that same logic, the Falcon is selling like Hotcakes! Every shipment they make is almost immediately sold! Even more so, the TT is a best-seller, since each batch sells out so fast that it's been almost impossible to find one for a long time! :-) If you only make one unit, it sure sells out fast...

~Chris

Well, 3DO's product is shipping now. :) Where's CD^32 in America?

## 2298. Compression for Jaguar?

Newsgroup: comp.sys.atari.advocacy
Date: 1993-10-06 00:07:38 UTC
From: ksmith@vaxc.stevens-tech.edu
Message-ID: <1993Oct5.190738.1@vaxc.stevens-tech.edu>
Source record: 20983

I heard that the jaguar will be able to handle carts which are 48 mb without compression, and much more with compression. my question is, do you think Atari and the 3rd parties will use this compression at all? I'd hate to be playing games that can only go up to 48 mb, on a 64-bit machine all the time. What are the advantages/disadvantages of using compression? Wouldn't it be easier for the games to all use this compression?

Well, i'm no computer engineer so be careful/explanatory in the description.

thanks.

k.s.

|> Sigh......SuperBase is a port of an ST program, with the latest versions STILL
|> being released for the ST (well, the Falcon).

SuperBase ISN't a port of an ST program. I think maybe there's a database
there with different versions and same name.

SuperBase guys actually made versions before for the C-64. This SuperBase
has a Windows version too.

|> > Deskop Publishing:

|> sound, music, EPLD design.......

Oh, really? Okay, a challenge for you:

I need to synchronize Animation and sound. I need to put sound together
at the same time the animation plays.

The animation must play at far more than 256 colors (near 24-bit, but
since impossible on the Falcon, let's accept 'true color'). Full screen.
I need to do ray traced animations and 2D animations.

Tell me what programs I can use on the Falcon that will crush
the Amiga A1200 I use for doings this things?

|>

When did Softlogic stop supporting the Atari? They are still selling
PageStream 2.2 from what I understand. They are just holding off
porting version 3.0 until (or if) Atari sales pick up.

I also want to make a comment about PageStream versus Calamus. In my
opinion, neither one of them beat out the other. They both have their
strong points. Personally, I picked PageStream over Calamus
because of two major reasons: 1) Price (PageStream costs much less
than Calamus SL). 2) Support for postscript (PageStream fully
supports postscript while Calamus did not).

Finally, I hope that people won't give up on PageStream just because
the Atari version is not the latest version available. Version 2.2 is
still very powerful and useful. Most people probably couldn't use all
of its features anyway. In fact, if people want to see version 3.0
then they should buy version 2.2. If sales pick up, then Softlogic
will have some incentive to port 3.0 over.

|> CO> except when he/she has fun in torturing the eyes.
|>
|> No need to interlace that mode, just use monochrome as the TT and the bandwidth
|> can handle it.

Ok, let's do some calculation about that. For 1,280 x 960 = 1,228,800 pixels to be displayed 72 times a second, you need a clock frequency of 1,228,800 x 72 Hz, that is MORE THAN 88 MHz! Just try to run the video chip in the Falcon at that speed. How do you want to do that?

So you won't get that resolution at a frequency of 70 Hz or more out of your Falcon, even not with Screenblaster.

And even if you did - the problem would still be that the hardware costs for the monitor were higher for the Falcon:
The TT sends a digital ECL signal to display the monochrome resolution. The Falcon always sends an analog signal. Now if you want to buy a 19, 20 or 21" monitor that can display 1280x960 in a reasonable size so that also smaller fonts are still readable, you have the choice between a TTM-195, a ProScreenTT and an EIZO 6500 for the TT - at least these three ones are able to display the ECL signal.
But which 19, 20 or 21" monitors are there that can display an analog signal? Yes, the EIZO 6500 can also do that. But then you don't have the choice any more and have to take the most expensive one.

The three monitors I've mentioned cannot display any colour resolution, that's true. But if you do serious work on your machine, you don't need color anyway - gray scales are sometimes useful. AND THAT'S WHAT MY ORIGINAL POSTING WAS ABOUT:
The TT is a better machine FOR SERIOUS WORK.

By the way, have you already read the message in comp.sys.atari.st where a user has blown the Falcon video chip with a graphic extension?

|> CO> In the TT the FPU is standard and you don't have to pay anything extra for
|> CO> that.
|>

|> What about those who has no use for it at all? (It doesn't speed up ALL math,
|> just Floating point .. how often does a program use that?)

Ok, you're right.

|> CO> The later series of the TT don't need an extra FAST RAM board.
|> CO> It's also standard and again you don't have to pay for it.
|>
|> Sure, at extra cost.

What do you want to say? Extra costs for what in which machine?

|>
|> CO> |> What you gain? Can you say SOUND&GRAPHICS very fast? :-)

1) I'm not interested in super sound capabilities of the machine
itself. And for MIDI, it doesn't matter anyway, then it's more
important to have good software and MIDI hardware (i.e. MIDI
instruments).

2) Concerning normal VDI operations, the TT is still a lot
faster than the Falcon, also with NVDI on both machines.
The TT high resolution isn't possible on a Falcon.

|> CO> CPU speed, FPU, FAST RAM, much higher resolution with a sharp
|> CO> and absolutely flickerfree picture. Everything without extra
|> CO> costs.

|> Yep, and then a decent graphics card costs LOADS of money, what about sound?

Graphics: What graphics cards are there for the Falcon and what do they cost?
Graphics cards are not necessary for the Falcon? Well, and if I wanted
to display an entire page on the screen, including window elements
and other things for interaction with the program?

Sound : See above.

|> What about 640*480*256? 800*600*256? All without extra hardware, right out of
|> the box ..

The extra hardware you need is a good and larger monitor. And these resolutions
are still too low for agreeable work with programs like Calamus, SciGraph or TeX.

|> The ONLY reason for not switching from the TT to the Falcon is the 16Mhz CPU
|> ...

... and the better expandability.

Besides the hardware INSIDE the computers, you should perhaps also take a look
at the outside. The Falcon needs more space on a desk. Its keyboard is absolutely
awful. Just type in a ten page LaTeX document. Have fun.

|> CO> Ok, of course there also are problems in the PC world when it comes to
|> CO> upgrading a machine. But generally, it's much easier and also cheaper.
|> CO> Nobody can deny that.

|>
|> Well, I do .. :-) ...

I said: Generally, it's much easier and also cheaper to expand. Just tell me one typical hardware extension, both available for the Falcon and the PC, that is cheaper for the Falcon.

Chris.

# 2311. Jaguar delayed?

Newsgroup: comp.sys.atari.advocacy
Date: 1993-10-06 16:07:06 UTC
From: ricardo@rchland.vnet.ibm.com
Message-ID: <1993Oct06.160706.26791@rchland.ibm.com>
Source record: 21004
Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.st

```
- Sunnyvale, CA JAGUAR TO BE DELAYED 'TILL AFTER CHRISTMA
-------------

Our ever vigilant observers have reported the Jaguar is now expected to
ship shortly AFTER Christmas 1993. This is in direct contradiction to t
plans announced detailing a drive to ship to New York City and Los Angel
in time for Christmas. While some observers where somewhat disturbed by
this news others shrugged it off with the comments; "So what else is new
with Atari? They're running true to form!"

------------------------------

There are several rumours starting to fly about possible Jaguar
delay.

DISCLAIMER:

This are so far unconfirmed rumours, although they seem to start
materializing (from different sources, same thing). I am also interested
in seeing the Jaguar rolling out. This could be true or false, although
seems more likely to be true.

-------> BTW, release date for CD-32 is October 1993.

Safe Harbor expects it sometime this month and they are
going to sell it for $385 US dollars.

## 2312. Downloading from Unix to Atari.....?

Newsgroup: comp.sys.atari.advocacy
Date: 1993-10-06 16:19:38 UTC
From: olly@festival.ed.ac.uk
Message-ID: <CEHHCr.4DC@festival.ed.ac.uk>
Source record: 20992

I want to get some PD software for a friend who's got an atari, and I know nothing about Atari's. Could someone help me with a few questions?

1- Can a DOS disk be read by an Atari?
2- The information on Gopher mentions .ttp files. Are these the Atari equivalent of EXE's?
3- If I transfer a ttp file to an Atari, can it be run directly, or does the OS require some attributes to be set to indicate it is an executable?
4- If the answer to 1 is no, how do you go about downloading files to an Atari if you don't have a direct connection to a Unix machine?

Thanks for any help,

Well, there may be a couple of reasons to avoid compression, but there
are also a few advantages. One drawback is that the machine is required
to uncompress the data into a useable form. This slows the machine down.
If speed is the goal, watch out. Also compression tends to "busy" up
the bus lines (although this shouldn't be a problem with a 64 bit
processor). These bus lines carry the information to and from the processor
and other parts of the machine. This again CAN bog things down, although
it won't necessarily.

Just a reminder, 48 Meg of terse code can create an AWESOME program.
The key word here is terse. Loose code is a terrible thing.
In my humble opinion, loose programming of games was one of the primary
downfalls of the ole 8-bit machine. (No flames, please)

> 1- Can a DOS disk be read by an Atari?

Yes.

> 2- The information on Gopher mentions .ttp files. Are these the Atari
> equivalent of EXE's?

The ttp means Tos Takes Parameters as far as I know
this is so you can include parameters in the command
and yes they are already executable.

> 3- If I transfer a ttp file to an Atari, can it be run
> directly, or does the OS require some attributes to be set to indicate
> it is an executable?

With a ttp program sometimes it needs a file to be dropped
on it that has the necessary parameters once it is loaded
in the Atari.

Hope this helps,
Scott

You're right. I've finally noticed that there still are some people that are able to see the facts and do not regard Atari computers as something you have to believe in like a religion.

Like Steve, I am an Atari TT owner and satisfied with this machine. But that doesn't mean that I think that Atari computers are the greatest in the world and would never ever buy a machine from a different manufacturer.

Chris.

Not that I know otherwise, but this has obviously been taken from STReport, which isn't exactly known for accuracy. Notice, for example, the cities mentioned for the fall rollout: "everyone" knows the initial markets targeted are New York City, _San Francisco_, and now Dallas.

>>used in tandam to good effect but in brute processing power, it's no contest. Anyone

Since it's no contest, are you saying a 486/66 can process DSP algorithms
faster? than the Falcons 32Mhz DSP (which can be executed independantly of the
68030)???

>>that cares to argue otherwise is doing themself and the Atari community a diservice.
>
>I could not have said it better myself. Even Computer shopper has shown
>that a 486/66 is faster and more powerful than a quadra 950 (albiet the
>8?0 is faster in some areas).
>People that argue that the falcon ot TT is more powerful than a 486 dx2
>are computer illiterate. Period.

No intelligent person would directly compare these two computers.
The true power of a computer can only be determined by the output of the code
written to interface the processor with connected peripherals.
General speed and power depends not only on the processor, but also on whatever
peripheral it requires (often more than one). Of course the 486/66 is internally
faster than a Falcon's 68030. Big deal! the dx2/66 motherboard costs almost as
much as a Falcon... Now compare these two... A motherboard alone is useless...
Those I have quoted say the 486/66 is "better" than the FALCON.
For the price of a Falcon, it offers excellent performance!
Do you really need more than a 16-bit colour palette for video (the system
outputs directly to a TV, (you knew that)).
For graphics, why smaller pixels? buy a larger monitor?
For sound, who needs more than 16-bit multichannel stereo output (standard)
,input and a DSP linked directly via DMA. Can the 486/66 really perform DSP
algorithms faster than the independant 32Mhz DSP available to the Falcon
and still have more remaining power than the 68030?

I use both... They are both good! As a 680x0 and 80x86 programmer, I
must say I prefer the structure of the Motorola processor. No worry about
memory segment limits etc... No redundant compatibility instructions...

As an applications user, the DX2 has the advantage of having so much more
software available. Maybe if I were not a programmer, I might not YET have
chosen the Falcon as my first choice system...!!!

Hello. I was wondering if any of you remember AtariForce, first a pack-in comic book with Defender, Bezerk, Star Raiders, Pheonix, and Galaxian, and then an independant DC comic book (20 issues and a Special). I own every one except the last pack-in with Galaxian. Does any body have this one and is willing to part with it? If so, please E-mail me at sjjacobi@eniac.seas.upenn.edu . Thank you very much. Along those lines, how about SwordQuest? I have the first, but I lost the second, and I don't even know if the third came out. (I know the fourth didn't). I'd also be interested in getting my hands on two and three(?) so let me know.

I'm willing to bet I would. Why? Because I do video work and the
amount of transitions in intensities is limited compared to a 24-bit palette.

No flame intended, but I have tried that before. Even in VGA's
18-bit I can notice it!

>850 million

Some have eyes yet cannot see.
This 850 million figure is a false figure. It refers to monochrome pixels.
The Jaguar works in a 32bit image space so divide it by 32 to get 26 million
pixels per second. Then further remember that this figure for the Jag
is derived purely from the peak bus bandwidth while bursting. Say halve
it for the effective rate. Then begin comparing it to 3do.

The A1200 also has tons of hardware and features not found in the Falcon (Graphics processor, 24 bit palette, much higher resoloutions with more colours). It has a 32 bit data bus as opposed to the Falcon's 16 bits. More expansion capibility (You can already buy 50MHz 68030 boards) a better operating system (some features like dayatypes, localisation etc. are really nice), much better software support, and it costs less.

While you guys are arguing about whether or not C= or Atari are dying, here is a little story that may warm a few hearts ....

About two weeks ago when I got my Falcon 030 I was messing about with some programs when the computer booted up with German defaults.
Turned out that I had messed about with the internal NVRam, and had set the German defaults. I posted a note to the net asking what the hell I had done, and got many replies back (thanx guys). Also I sent in my registration to Atari Oz, and sent in a copy of the problems that I had encountered.

Yesterday about 16:00 I got a call from Atari Oz. They had rung up to see if I ahd fixed the problem, and were anxious to see what I had done.

Now is it just me, or does it seem as if Atari Oz are not dead just yet, or am I purely an optimist?

Karl.

after reading this area for the past few days, my attitude has
gone from mild amusement being mildly pissed off..

First off, I would like to say that if you buy a Falcon for anything
except MIDI, you are completely wasting your time. No one except
the most die-hard ST fanatic is going to buy one, and once again
most are going to defect to the PC.. Seriously, think about it..
The Falcon a commercial success?? I would *LOVE* to see it a success
cause I really like the machine, but..

Also, as little as I know about "3dO" or whatever, what was the
price quoted on it?? $300? $500? Something like that? Does
ANYONE actually think that this is going to be accepted by
Joe and Jane Public? Does anyone remember CDI, or CD+G? Even
laserdisc players, after finally dropping below $500 for low-end
models, are being slow to be accepted.. Living in this nice little
computer-geek world, it might be a "neat" idea to think that
the public is going to go "W0W!!!@1 tRuE mUltImeDi/-\ wItH a
cD pLaYeR!!@1!" Give me a break.. no one but a diehard geek
will go for this.. I have little interest in Interactive TV
myself.. I just want to watch ESPN and play video games, like 99%
of everyone else.

also, what you anal-retentive types need 2 realize is that there
are many people out there (again, 95% of us) who don't give a sh*t
about tech specs. "uninformed" college students and adults still
think this "obsolete" A2000 is kick ass, despite its sl0W pr0cess0r
spEeD!!@ Jesus Christ, why not just enjoy your computers for what
they are!! I know this Amiga will never compete with a PC in
business applications!

You didn't include your source, but I'm sure this "news" item came from ST REPORT. Of course, ST REPORT is the National Enquirer of the Atari world, and its editor is out to slander Atari any chance he gets.

I'd take this "news" with a MASSIVE grain of salt.

>AH, but there's a problem with that little magic number:
> When ATARI said that, did they reffer to 24-bit pixels or 1-bit pixels?

Gamepro always quotes 1 bit pixels for everything

>You know, marketting can cloud things up in very interesting ways.
> And at the very end, even if they are 24-bit pixels who gives a damn
>if the end result is the same? BTW, your 3DO spec is wrong:
> It is 64 million.

Apologies for the spec...and the end result is NOT the same. Having
more than 10 times the 'blitting' power in the Jaguar at 1/3 the price
(2/3 w/CD) means the Jag has more power for les $$

Allen

Yes. The A500+ and the A600 will do 640*480, 640*400 and 640*512, non-interlaced in 4 colours. Both machines are, however, now obselete.

Thanks for clarifying. Just in case, the rumours are still unconfirmed
and so far, there's now evidence to the side that ATARI will released
the latest date they have been promising.

I definitively want to see one.

Yeah, I agree with you about the 3DO - once the tech geeks have bought
them (and filter that to Rich Tech Geeks!!) who else will buy one? On CBS
This Morning they had a segment with the 3DO and the Jag. At the end,
the announcer said "$700? Do they think people will pay that much?"
And the correspondent said that the price will come down next year.
If enough people hear that, who will buy one this year? $700 is a bit
beyond "christmas present" for all but the most affluent.

also, what you anal-retentive types need 2 realize is that there
are many people out there (again, 95% of us) who don't give a sh*t

Because I don't really consider 16 bit to be a valid graphics mode. It's
just 15 bit with an extra bit for green. Whoopie. I think it's better to
use that extra bit as an aplha plane for overlay stuff. ;)

>Since it's no contest, are you saying a 486/66 can process DSP algorithms
>faster? than the Falcons 32Mhz DSP (which can be executed independantly of the
>68030)???
No that's not what I said at all. I said a 486/66 is more powerful than
a 68030/16.

>General speed and power depends not only on the processor, but also on whatever
>peripheral it requires (often more than one). Of course the 486/66 is internally
>faster than a Falcon's 68030. Big deal! the dx2/66 motherboard costs almost as
>much as a Falcon... Now compare these two... A motherboard alone is useless...
I don't think so! a 486/66 motherboard costs 475GBP A Falcon costs 999GBP.
I can get a 486SX25 with 4Mb RAM 170Mb HD & CDROM for 740GBP.

>Those I have quoted say the 486/66 is "better" than the FALCON.
>For the price of a Falcon, it offers excellent performance!
Oh come on, for the price, the Falcons performance is dismal! I bought one
because I have a huge amount of ST software & peripherals that I like
sing and suits my needs. i just wanted it to run faster and I also liked
the sound of the software planned for the falcon. It's faster than a MSTe
but not by much.

>Do you really need more than a 16-bit colour palette for video (the system
>outputs directly to a TV, (you knew that)).
You would have to be mad to buy a Falcon and then use it on a TV.

>For graphics, why smaller pixels? buy a larger monitor?
Agreed.

>For sound, who needs more than 16-bit multichannel stereo output (standard)
>,input and a DSP linked directly via DMA. Can the 486/66 really perform DSP
>algorithms faster than the independant 32Mhz DSP available to the Falcon
>and still have more remaining power than the 68030?
Probably not but a 486/66 with a DSP board would eat it for breakfast - even
if it did cost more.

>I use both... They are both good! As a 680x0 and 80x86 programmer, I
>must say I prefer the structure of the Motorola processor. No worry about
>memory segment limits etc... No redundant compatibility instructions...
Too true. segements are more of a DOS problem though. Programming Unix
on PCs doesn't have that problem.

You do professional work, so I believe that you can tell the difference, but don't try to say that you CANNOT tell the difference between HAM8 and true 24 bit. I doubt I'd believe you. My point was that the "joe average user" who cannot tell between HAM8 and 24 bit also wouldn't be able to tell between 15 bit and 24 bit.

CB> 32 bit data bus as opposed to the Falcon's 16 bits. More expansion

I've heard this over and over again .... look at this:

Atari needed space on the motherboard, to cut cost.
Effective way to reduce size - go from 32 datalines to 16.
Now what do we do to not loose speed?
Run the bus at 32Mhz, use our own multiplexer to feed the 68030 two 16-bit words at a time, thus the 68030 THINKS THE BUS IS 32 BIT 16 MHZ!

I'm not saying this IS the truth, because I haven't checked. But it fits right in with the fact Atari technicians has let out. (32Mhz bus system 68030 is connected 32/32)

If this is true, then the Falcon030 has burst mode and EVERYTHING a 16Mhz 32 bit system has ...

Yep, no problem there... If he has TOS >1.4 he can also format PC compatible
disks without extra programs.

> 2- The information on Gopher mentions .ttp files. Are these the
> Atari equivalent of EXE's?

Well, I guess you could say that (or is it more .COM like?), they are
executable at least. Other executable extensions are .TOS .PRG .GTP .APP...

> 3- If I transfer a ttp file to an Atari, can it be run

: RH> better graphics, etc....
:
: I use my STE to run my BBS. In 640*400 NI ... Can the A500 do 640*400 NI?

Using a flicker fixer, an A500 can do 640x400 NI in 16 colours.
How many colours does the ST have in that mode? Two perhaps?
A flicker fixer costs about the 1.5-2x price of an external disk
drive, so it's not that much.

: Better sound? Laughter. The STE has better sound than the A500. (50Khz)

The STE has a very poor sound system. The Falcon has a much improved
sound system. You're talking about sampling rates, aren't you?
50 Khz is for dogs and party-tricks, breaking windows with enough
amplification.

The STE was a poor attempt by Atari to one-up or me-too! the specs
of an Amiga 500. They bodged in a blitter and tarted up the pallette
so it could match the 4096 colours of the A500.

: RH> Where's the ATARI ST-CD ROM?
:
: Why make an own CD-ROM when you can hook up ANY standard SCSI-II CD-ROM to the
: Falcon without ANY extra cards?

What specific CD software is there for the Atari ST? Or Falcon for
that matter?

You've really got the Atari-is-superior bug. I hardly seen anyone
champion the Atari line so poorly. Next thing you're going to say
is that Motorola supply bung 040's to C=.

The thing that gets me is why people bought Atari ST's instead of
Amigas back in 85-90. The Falcon is significantly different than
Commodore's offerings, but the ST and STE weren't any better than
the Amiga's at that time and IMHO, they were poorer choices.

Initially, Atari ST software support was greater in Europe, but
the Amiga caught up fairly quickly and eventually had superior
games. Was the initial Atari ST public support (ie sales) due to

the games available? If Atari ST purchasers bought Amiga's instead, perhaps the C= and the motorola line of processor might have been in a healthier position today and had the support of the larger MS-DOS/Windows/Intel based application developers.

BTW Rickard, if you want to claim that the Amiga is just a games machine and the Atari line is for serious users, you haven't seen the aminet archives. There is close to a gigabyte of PD/Shareware software their for the Amiga, with a mix of serious applications, mods and demos, etc. What is the Atari archive like?

- Jim

Unfortunately, however much ST Report resembles the gossip rags in
style, their track record on accuracy is considerable. The IAAD has been
trying to plug the 'leak' for 2 1/2 years, and still hasn't managed it.
Plus, there are obviously enough dissatisfied employees at Atari to keep
Ralph well supplied with inside news.
Much as I dislike a lot of ST Report, I've found in the 5 years I've
been reading it, that his reporting eventually turns out to be generally
accurate, if sensationalist.
Why would Atari dislike him so much if he was wrong all the time?

Again, no flames. I understand what you guys are saying as I mentioned in
a posting above. I also said that I found more evidence now balancing
in favor of ATARI.

Contrary to what people might think there, I also want to see the Jaguar.

Funny, they sold about 300000 in this country.

|>
|> The A600 has had some SERIOUS price cuts .. Commodore sure must have lost a lot
|> of money on that one ..

It has had price cuts because it is obsolete. Commodore, unlike Atari no longer manufacture 16 bit computers.

|>
|> What monitor did they use for those resolutions?

A standard VGA monitor should do it. Any of Commodore's multisyncs will certainly display them

>500+, was that release? I've never seen one ..

Of course. It was introduced in 1990 and replaced the standard A500.
The A600 later replaced this.

>The A600 has had some SERIOUS price cuts .. Commodore sure must have lost a
>lot of money on that one ..

Think so? Well, they can lower the price even more without losing
money. All development costs have been recovered a long time ago, and
the A600 doesn't cost much to produce. What *does* cost though, is to
stock them, and that's why people are selling them cheap nowadays -
C= had a big stock they wanted to get rid of.

>What monitor did they use for those resolutions?

Same as you would for any non-interlaced hires resolution. VGA
or Multisync monitors.

>SB>
>SB> No, it's 8-bit pixels.

>8*60 means that the 3DO is STILL behind the Jaguar.

High numbers doesn't make a platform. Marketing and software does.
3DO has tons more credibility than Atari, and Atari has had a habit
of hyping products before release, and when the product finally ships
(one year after promise) much of the hyperbole turns out to be just that.

Remember the Falcon hype? I actually thought of getting one when I saw
the press releases from Atari claiming awesome graphics and processing
capability for a very low price ($700?). When it was finally released it
wasn't so interesting anymore - it turned out to be much more expensive,
and it's performance didn't live up to Atari's claims.

With the Jaguar, the history seem to repeat itself. It appears that the
Jaguar isn't going to cost $199 at all, but is going to sell for $250
to $299. Add the cost of a CD to that, claimed to cost $200-$250, and
you're up to the 3DO player cost. Judging from the screenshots I've seen
so far, the software isn't going to be too hot either. I've seen better
graphics in standard Amiga games. Very unimpressive.

That's very different from `being done in hardware', isn't it? By
the same logic, I can claim that my A4000 does ZModem and vt102
emulation in hardware.

see stuff like this! :)

Atari (as far as I know) is only making Falcons and *maybe* TTs. These
are both 68030 machines. I think the STes are not being made, at least
over here in the USA.

All chips except the 68030 access RAM 32 bits at a time.
The 68030 itself accesses RAM 16-bits at a time.

What are you trying to insinuate? That the Falcon is a 16-bit computer?
That would be ludicrous, considering that out of the box, it outperforms
the "32-bit" A1200.

<which incidentally still has a "16-bit" Blitter, "8-bit" sound, and "16-bit"
disk access... gee, what does that make it? :) >

I've played a 3DO. It's nice. I don't think they are in a position to be
too trusted. After all they are new, and as of this minute, the selection of
games is woefully inadequate.

But also, it's more than the Jaguar or CD^32 has.

> Remember the Falcon hype? I actually thought of getting one when I saw

Jaguars will sell for $250 initially... I knew that before they even
said it would because the dealers we spoke to knew there was (dare i say
this word about an Atari?) *demand*. This is before Bob Brodie said it
would run $250.

Now, considering Atari needs to build up dealer confidence, what better way
to do that than to let them turn big profits on the product?

<and what better way to improve your profits than to jack the price up?>

The first 50,000 machines are practically sold.

As for the graphics, well..... you've only seen screenshots. Probably not
even full-page color ones. I'd wait until we had more info before coming
to a conclusion.

And for the same price as an 'out of the box' Falcon you can buy an A1200 with
FASTRAM which outperforms said Falcon.

|>
|> <which incidentally still has a "16-bit" Blitter, "8-bit" sound, and "16-bit"
|> disk access... gee, what does that make it? :) >

a full 32 bit computer with 24 bit graphics.

Chris Brown

Last I heard, Motorola wasn't even going to manufacture the 601
processor, starting instead with a more-advanced unit such as the
602. Given that info, I wouldn't be waiting for an Atari-labeled
601-based system.

Well, as far as the rep, Atari is going to be selling the Jag mostly
to people who have not heard of Atari for years!! The computer rep
they have will be essentially unknown to most people. As far as the
$200 price, only the most fanatical of gamers will have heard of it
anyway, so that won't hurt thier rep. What I think they plan to do is
lower the price of the system to $200 ion the Nationwide release, and
perhaps make a little more money off of the initial systems (why not?
3DO is in a big way).

As far as the games shown on CBS, I'll agree that they didn't look as
sparkly as they might have - but then again, we may not have seen
final versions, and we didn't see Preditor VS. Alien (or is it the
other way round?) at all (what I really wanted to see!!). And if you
compare Cybermorph to Starfox, Cybermorph was much better!! It had
smooth shaded hills with more than one color, and animation was very
smooth. I myself would have liked to see a more detailed ship, but
maybe there will be one in the final version - remember, that morphing
is done in hardware, so all they would have to do is come up with more
detailed ship models for each ship configuration, and the hardware
will do the morphing for them (no more programming involved). Raiden
also looked OK to me, and if they have the sound faithfully repoduced
it could be really good.

Did you watch Future Watch on CNN this saturday/sunday?

Lots of coverage on the new VR and Games-systems ....

They finished with some Silicon Graphics movies, stating that Nintendo and SG would make a 64-bit system that would be out in the stores '95 ...

...and then they said...

IBM and ATARI has developed their own 64-bit system, the "Jaguar", which will be out '93 in New York and San Fransisco - nationwide 1:st quarter '94.

Both systems will retail under $250.

They didn't mention the 3DO.

They didn't mention the CD32.

Guess who many viewers CNN has.

Thats besides the point - Pagestream did not leave the Atari (they continued developing) until
AFTER Calamus was released. Perhaps there was an Amiga version of Pagestream before Calamus came
out. So what ? Thats just multiplatform development, not abandonning a platform.

>|> > Deskop Publishing:
>|> >
>|> > DTP programs: ProPage 4.1
>|> > PageStream 3.0
>|>
>|> Come now - no one believes in the Amiga as a DTP system, no one ever has....

Uhm.. The STE has *much* better sound than the A500, it even has better sound
than anything Commodore has come up with so far.

[stuff deleted]

[sigs deleted]

Before this subject drops, just what sort of sound did the STE come with?
I do know that an STfm came with a 3 voice/8 octave Yamaha sound chip.
And as far as I know, for compatability reasons Atari stuck with it for the STe.

Although I do believe that the STE had stereo capabilities. Like to enlighten
me ?

Believe me, if you take the same raw 24 bit file, conevrt it to dithered HAM8 and dithered 256 colours, the HAM-8 looks infinitley better. 800*600 HAM-8 looks real, and much better than anything a Flacon could do..

What is really cool is to open a HAM-8 public screen, and set it to the default, then you can run your programs in ity, and have a few JPEG's in windows. It's a little slow, but looks really fantastic.

:Funny, they sold about 300000 in this country.

[stuff deleted]

Yep and not forgetting 1280x512, and 1280x256. And 800x600 (non-interlaced) although you do need an A2024 monitor to display that. Incidently it's called producitivity. You do need the ECS chipset and above for this though.

Has anyone in the whole big world made an genlock which uses that overlay bit?
I would like to make one, but I have not the list of the items to put together.

But as Atari said (:-) it should be 'easy' do make one. Why aren't there any
around?

Well, running on a RISC-chip with it's own SRAM you could say it's in hardware,
at least it runs as fast as if it was in hardware. BTW do all those modems
compress their data in hardware or software?
If you say they compress in hardware then the jaguar does it in hardware.
If you say they do it in software then the jaguar does it in software too.
Now choose!!!!

Have you seen the 220 pin chip on the motherboard? It was a LOT cheaper to do
it in 220 pins instead of 236 pins. That's the whole reason. And this 220 pin
chip is also the reason why the F030 does not slow down so horribly if it has
to display 8 bit grafix (A1200 IS slow in HAM8, does it have 256 color mode?)

3DO CEO Trip Hawkins demoed PGA Tour Golf, saying it has, "The look and feel of a TV broadcast." Kirkland, Washington's Boy Scout troop 616 was given an opportunity to play with a 3DO machine - the comments from the Scouts ranged from, "It's cool" to "A lot better than Super Nintendo and Genesis."
Weisbaum warned, "Right now, 3DO stands alone. But not for long."
Suddenly, the familiar Fuji and the ATARI logo appeared on screen - Atari's first direct mention.

The Jaguar was presented as "an even more powerful system," a 64-bit machine to sell for "just 250 dollars", and to which a $200 CD-ROM can be added. The Jaguar, a controller, and a CD-ROM unit attached to another Jaguar - all sitting in front of a Jaguar shipping box - were displayed.

Cuts from Crescent Galaxy, Cybermorph and Raiden were shown being played: "The first time Jaguar software has been seen on TV. The games are colorful, fast-paced, with lots of action."

Atari President Sam Tramiel said, "I love shoot'em up games. That's what people like to play.... The big thing is to have a lot of fun with your software. That's the key."

Glenn Rubenstein, a videogame reviewer for the San Francisco Examiner, was seen having been given some time to spend with a Jaguar. "For 250 dollars, I'm very impressed with the Jaguar." Rubenstein laughed, "I would actually spend my own money. Not a lot of journalists would say that about a product, but I would actually go out and buy a Jaguar."

Weisbaum closed his report on Atari by saying Rubenstein would have to wait until November for the Jaguar's San Francisco and New York rollout, with national distribution coming in 1994.

He then pointed out that 3DO is going to the stores now. For $700. CBS This Morning anchor Harry Smith asked Weisbaum, "Who's going to pay that?"

Weisbaum answered, "They [3DO] say people will for brand new technology."

He also added that the machines (both 3DO and Jaguar) will be able to connect to digital networks to enable players to play games linked across the country.
Harry Smith neatly summed up the segment, "Hot stuff, Herb."

//// From the background I was given, CBS was planning a story on 3DO, when they heard about Atari's Jaguar. After spending 4 hours at Atari on Tuesday, they felt that it was worthy to include it in their story.

//// The Atari logo and Fuji shown in the broadcast should be part of what appears when you power up a Jaguar without a cartridge or CD-ROM installed.
//// I reached Herb Weisbaum later in the day by phone, and asked him what were his personal impressions on both machines. He declined to take a stand on that, saying, "At this moment, I have trouble playing Pong."

//// Atari Corp. also confirmed via phone that the Atari Jaguar will retail for $249. This includes one controller and one pack-in game.

//// CBS This Morning airs weekdays on most CBS stations from 7am to 9am (Eastern and Pacific times) and 6am to 8am (Central time).

There are several games available for CD32 here in Europe. Obviously,
there aren't any games in the states since the CD32 hasn't been released
there, even.

Not quite. A2024 is 1024*1024 non interlaced. 800*600 is super 72 and it is interlaced (and yes, the 500+ and 600 can do all these resoloutions)

The resoloution of the AGA machines is exactly the same as the ECS machines, but all modes have up to 8 bits per pixel, and include both HAM modes. This means you can do 1280*512 or 720*1024 (interlaced) in over a quater of a million colours.

Have you tried an A1200 with fastram? High colour displays do not slow down user programs at all then. If I open a 784*1100 HAM-8 screen, I wouldnt expect it to update as fast as a 640*256 4 colour screen (What readers of this group are used to?)

Oh, and how many bitplanes is HAM-8? (I'll give you a clue, HAM-6 uses 6), and AGA has 256 colour registers (24 bit), so yes, it does have a 256 colour mode (as well as 128,64,32,16,8,4 and 2 colour modes)

WHOA! But RICKARD! Atari HAS released an official developers list...among
which are Maxis, Ocean, US Gold, Tiertex, Loriciel, Silmarils, Anco and so
on...

It has also been said here on Usenet (rec.games.video.misc) that at least
two LARGE developers who is now developing games for both the SNES and
the Genesis (Megadrive) has signed a developer's contract, although these
two names will be released along with the major Jaguar roll-out early 1994.

> to?)
Ha, wow, what an argument, really great!!! OF COURSE IT DOES NOT SLOW DOWN
WHEN YOU PUT THE PROGRAM INTO FASTRAM. But I'm comparing the CHIPRAM of the
A1200 to the CHIPRAM of the Falcon. And btw. The falcon can have 14MB of
chipram but the A1200 only 2MB (or 4?). A stock A1200 or Falcon has no chipram.
SO PLEASE COMPARE THINGS ON THE SAME BASIS!!!!

********* YES I KNOW THE A1200 COSTS LESS !!! *********

> well as 128,64,32,16,8,4 and 2 colour modes)

That's nice. Can you tell me how much the slow-down from 4 color to 256 color
is?

Now, there you are completely wrong. It's one stero voice (or two mono if
you want) which can play at 4 different speeds (6,12,25 or 50kHz). That's
all.

Georges.

Well, here is the OverScan statement:
'We will not do a genlock for only one resolution'
So they sell one for all ST's and falcon for 600DM, but the overlay-bit
genlock only would cost 100DM.

A stock A1200 has no chipram? Mine did.. Hmmm, maybe this is a policy change by Commodore. Bit silly of them to sell machines without any display capibility though. :-)

AH, but that's ATARI.

|>
|> What does Aikaido do, exactly?

Helps in the chunky to planar conversion. I am also trying to find out exactly what it does. It is either: read memory feeding the custom chips or what I heard later: 68020 feeds it, and reads converted data from it (which is not as good as it should be, but surely helps).

|> RH> Dude, was the ASM programmer that told you that working for your

Well, and what do you think 3DO is doing? Magic? They also use a double-speed CD-ROM but since the data is compressed, they can do decnt animation.

BTW, 25 fps is very decent animation. Movies in theaters run at 24fps.

Ah, but guess what (and this is true): The Jaguar price increased.
Lowest price by mail order here in the US is now $240. Retail they say is $300.

And remember, you get a double speed CD-ROM with the CD-32.

It's really but really hard. In most pictures is virtually impossible on RGB.
When you dumpt the signal to video, it's
virtually impossible no matter what.

If you use 1280 horizontal res, then it becomes virtually impossible
whether RGB or not.

I doubt I'd believe you. My point was that the "joe average
|> user" who cannot tell between HAM8 and 24 bit also wouldn't be able to tell
|> between 15 bit and 24 bit.
|>
|> ~Chris (P.S. Got my Falcon TOday! Yippee!)

Chris, to be fair, this depends on the picture. If the picture has like a
sky and needs subtle light transitions (or a night scene), it will look different.

Oh really? What are those 'secret terms' I won't understand?

Pantone? Bezier curves? Postscript? Kerning? I'm curious.

|> > Or maybe that you can't coment on more than Calamus and MIDI apps....
|> >What about m-media programs, video, imageprocessing, other areas?
|>
|> Video Master, Cubase Video (never being released for the Amiga, but due on the Falcon RSN),

Well, they aren't released yet anyway, while the Amiga has the VideoToaster, OpalVision, SuperGen, IV24, V-lab, etc. NICE TRY.

|> Chagall (image processing), Galaxy & CLA2 (electronic CAD / Sim / Synthesis) ......
|> Come now, do I have to document EVERY program in every field of developement???

Nope. They are so few though.

|> (InShape, AutoDesk Animator, XenoMorph, Video Master, Chloe, Cubase Video....)

So can you? AutoDesk Animator hasn't been released, and a lot of 3D programs
on the Amiga blow it away anyway. Didn't you say that Video Master and Cubase Video
*ARE NOT RELESED YET?*

Are you ignorant, dumb or what? I'm doing those things today... no need
to wait.

Exactly. Which is why I can put in FAST RAM, a 68030 @ 50Mhz accelerator
and an FPU and compare against the Falcon.

>Before this subject drops, just what sort of sound did the STE come with?
>I do know that an STfm came with a 3 voice/8 octave Yamaha sound chip.
>And as far as I know, for compatability reasons Atari stuck with it for the STe.

>Although I do believe that the STE had stereo capabilities. Like to enlighten
>me ?

The STe can play 8 bits samples in upto 50kHz stereo, ie. it has 2 DAC's (In
addition to the dinky Yamaha-chip). It also have bass & treble control.

But by using various techniques you can 4 channels in upto 50kHz or 8 channels
in upto 25kHz. In quality and channels it beats the Amiga. The only trouble is
that you have to use the main-cpu to produce the sound. (urgle)

Conclusion: The STe has better "sound", the Amiga has a better "soundsystem".

(By STe I mean STe, Mega STe & TT)

There are two 8 channels demos at atari.archive.umich.edu (or a mirror of it)
if you are interested, which can be found in:
/atari/Demos/epssatom.zip
/atari/Ste/dynamite.arc

I know there's something called Octalyzer too, but I don't know where it can be
found or how it sounds.

Along with the inferior hardware. :)

Face it, if the demand is there, Atari would jack the price up to $300 or $400
if they could. Going to $250 is minor as the people who are lining up to
buy them now are willing to pay that premium, and this price is only on the
first 50,000 units.

Also, I've heard there is some sort of special casing or some-such-or-the-other
that will come with it that marks these as the first batch, making them
possible collector's items for those into that sort of thing.

>RH> Ah, let me guess. Commodore designs a CPU to aid in the chunky->planar
>RH> conversion and it can be done faster on the 68020 ASM?

>What does Aikaido do, exactly?

Akiko just converts planar pixels to chunky pixels. Its basically
just a hardware implementation of a software algorithm. It is a bit
of a kludge as AFAIK it doesnt do the DMA for the screen, just
returns the values which you have to shove into screen memory - this
makes it much less useful than it could have been.

I gather that an 030 or 040 at 25Mhz can easily outperform the Akiko
for conversion, its just that on a standard CD32 with only a 68020
and chipram, the processor could do with help for chunky to planar
conversion. It may be possible that an A1200 with fastram could
match the Akiko for speed of conversion.

rickard.troedsson@troed.ct.se (Rickard Troedsson) writes...

>I use my STE to run my BBS. In 640*400 NI ... Can the A500 do 640*400 NI?

The A500+ can, but not the A500. The ST does this mode in monochrome
only, you get four colours on the A500+. Although the A500 can only
manage this mode interlaced, it does have the advantage of doing it
in 16 colours. You can always get a flickerfixer if you want, but
theres little point in arguing over obsolete machines now.

>Better sound? Laughter. The STE has better sound than the A500. (50Khz)

Yeah, loads of software uses 50Khz samples doesn`t it? The Amiga can
also be driven at 50Khz if you really want to, although you lose the
DMA capability and have to use processor power. Much better to have
four channels of DMA sound.

>Why make an own CD-ROM when you can hook up ANY standard SCSI-II CD-ROM to the
>Falcon without ANY extra cards?

Its always better to have an official product available if you want
developers to support a format. Just relying on people to go out and
buy SCSI CD-ROMS isnt going to encourage widespread adoption of the
format on the ST/Falcon.

>Compared to the Jag's price of $199, I don't think the CD32 has got a chance ..

I didnt think the Jaguar had a price yet, as it hasn`t been
released to date. Lets see what the prices are when it is released
on the `31st October` which is supposed to be its release date.

I dont think that the CD-less $199 version will be much good.
Better for Atari to have given ALL jaguars a CD ROM drive. Too much
confusion and uncertainty for developers unless you have a good base
machine.

Gavan

PS. The CD32 is doing *phenomanally* well in the UK - virtually all
stores selling it have sold out of stock. It`s also getting plenty
of publicity and it has a good `street cred` which helps to sell
consoles here. I don`t think the Jaguar will do very well here at
all, despite its alleged technical specs. If Atari don`t have it
out here by Xmas, then they can kiss any chances of success
goodbye....

## 2428. who cares ??!?!

>will go for this.. I have little interest in Interactive TV
>myself.. I just want to watch ESPN and play video games, like 99%
>of everyone else.

I couldn`t agree more. Excellent though the 3DO is, there just
isnt a market for it at that price. People couldnt give a damn about
multimedia (the consumer market, that is). They just want a machine
to play good games on at a cheap price. The ability to watch videos
(ie via MPEG off CD) would be a nice extra, but its not strictly
essential.

I`d say the sega mega-CD has the best chance of success in the
states. It may be crap technology but there is a lot of software
support for it and some of the games are quite good, despite the
technical limitations. The CD32 and Jaguar might make some inroads
in the US, but their chances are low.

In Europe I`d say that the CD32 will be a sucess. It can build
on the popularity of the Amiga and people can percieve the
advantages that the CD32 offers over the Sega, whilst costing less.
(Sega Mega CD2 ~ 350 UKP, CD32 ~ 300 UKP MRP)

The Jaguar? Without a CD as standard and with delays its
DEAD
DEAD
DEAD

Sorry, Atari fans, but thats the way it is

3DO? Niche market - should survive but won`t be a roaring
sucess, unless maybe the economy picks up and people are looking for
a new techno toy to spend their money on.

>the sound of the software planned for the falcon. It's faster than a MSTe
>but not by much.

Yep. Both the A4000 and the Falcon offer dismal performance for
the price. The only reason for people to buy either of these
machines is that they have (a) a particular function in mind or
(b) they are fanatical C= or Atari users
and want a better ST/Amiga

Where the Amiga scores is with the A1200 which is affordable, yet
powerful and expandable. You can buy a usable model for as little as
260 UKP and add a hard disk and extra memory later. This creates a
base of users who would want to upgrade to an A4000 later.

With the entry level Falcon at 900 UKP noone is going to buy one
as a general purpose machine when they could get a well specified
486 at the same price.

Oh dear Rickard, making things up again, are we - like your amazing
256 colour dual playfields mode?

It doesnt matter how fast the bus is - if the processor is 16 Mhz
then it can only accept data at 16 Mhz. The only things that think
the bus is 32 bit at 16 Mhz are desperate falcon owners.

Gavan

Uh, no---HAM is not 24 bit colour. Amigoids like to pretend it is but as each pixel cannot be individually set to a specific colour they are wrong.

And `full' 32 bit should mean *everything is 32 bits wide. Is it? No.

Talking bollocks again.

rickard.troedsson@troed.ct.se (Rickard Troedsson) writes ..

>500+, was that release? I've never seen one ..

It was in the UK. Just an A500 with KS 2 and full ECS including
the super denise. That gave it its 640x480 /4 colours non interlaced
mode which the A500 didnt have.

>The A600 has had some SERIOUS price cuts .. Commodore sure must have lost a lot
>of money on that one ..

The A600 is now also obsolete. I`ve seen many places selling their
remaining stocks very cheaply. eg. `Dixons` (a large UK electrical
goods retailer) is selling A600s and Atari STe s off at 150 UKP to
clear remaining stocks.
Dixons also sells the A1200 at MRP
It DOES NOT sell the Falcon.

>But also, it's more than the Jaguar or CD^32 has.

There is a reasonable selection of CD32 titles as of now.

It comes with Oscar and Diggers, you can get Pinball Fantasies and
RoboCod for it. It runs most of the old CDTV stuff too giving it
around 30 more titles (admittedly most CDTV is unimpressive). Theres
a large amount of software just about to come out on CD for the
CD32. Since its basically an A1200 almost any normal Amiga title can
simply be shoved onto CD for it and this will reflect in a wide
range of games early on for the consumer.

<jaguar>
>The first 50,000 machines are practically sold.

Atari will be lucky to sell a TOTAL of 50000 units in the (short)
lifetime of the Jaguar.

Last speed ratings I heard for the Falcons SCSI interface said it did something
like 1 meg per second. If this is true than the A1200's IDE is faster.

Who said anything about HAM? The A1200 has 256 24 bit registers. With a little
copper magic, any pixel on the screen can be one of 16777216 colours. HAM-8 is
pseudo 18 bit colour. (Although it is again possible to use all 16.8M colours
from HAM8) The Falcon has an 18 bit colour registers, and a 15 bit high-colour
mode. I'll take AGA and HAM-8 any day thanks.

|>
|> And `full' 32 bit should mean *everything is 32 bits wide. Is it? No.
No, just the data bus, which in the Falcons case is not.

Gavan, just a quick note: I doubt that a '030 or '040 would match
Akiko since Akiko is supposed to be 'zero wait state'-> Probably a circuit
that immediately has a value out when you give it a certain input (like
a hardwired implementation).

Talk to Motorola. Dude, I'm studying Computer Engineering, and what
you are saying doesn't make sense. The bus in the '030 expects to 'see'
32 bits of information. There has to be some middle buffer there that
will not be as fast as you imply (would have to predict from where to read
memory).

|>
|> >I'm not saying this IS the truth, because I haven't checked. But it fits right

|> >If this is true, then the Falcon030 has burst mode and EVERYTHING a 16Mhz 32
|> >bit system has ...

The Falcon CAN'T HAVE BURST MODE. DO YOU GET IT? Simple test for
Falconites:

Turn on the cache, run a couple of programs that take a long time.
Now do the same with the 'burst mode' enabled. Prediction is: NO DIFFERENCE.

|> Oh dear Rickard, making things up again, are we - like your amazing

> 602. Given that info, I wouldn't be waiting for an Atari-labeled
> 601-based system.

Partly right... Wade through the comp.sys.powerpc flamefield for a while... ;-) IBM is building the PPC601, which is essentially a transition chip between the RIOS chipset used in the RS/6000 workstations. Motorola will produce the PPC603, which requires less power, etc, and will be a "true" 64-bit CPU (unlike the PPC601, which is a 32/64, like the 68000 is a 16/32)... Motorola employees are saying it'll be a bit faster than the 601, too...

If I were waiting for anything from Atari, I'd be twiddling my tumbs in front of the TV (where I actually saw Sam Tramiel and a Jaguar the other night, much to my surprise).

That is absolutely not true! I just got a new SCSI-2 drive hooked onto
my Falcon (it's a Maxtor for those who care) and it's getting over 4 megs
a second!

Does it really? The report you quoted was *very* slanted in Atari's
favor. The reports from people in rec.games.video.misc were quite
different. Almost everybody (including Jaguar advocates) agreed that
the games shown for 3DO stomped all over the Jaguar ones. I tend to
believe them.

Aargh...
I have a Quantum LPS240 connected to my Falcon. With this drive I get
1.6 MByte/s!
And this Quantum drive is a cheap one (~$300). With better drives you can get
more than 10 MByte/s.
By the way: someone has asked if the Falcon has "Wide SCSI". Of course NOT!
A "Wide SCSI" interface still costs more than $800 and I only know 3 HD drives
able to use this interface (all in the GigaByte section...).

Ciao, Heiko.

It's also interesting to note that Atari's stock in the U.S. is
somewhere in the $7 range just about now (it'll be curious to see what
it finishes at). Perhaps this (as well as the CBS appearance) is
helping Atari out.

Now if they could only get an Atari Falcon or Jaguar on the
David Letterman show in the U.S., that would be a major positive kick...

Hahahahohohohihihi ROTFL...
I have been waiting a long time before someone finally mentions the 16bit
databus of the Jaguar's 68000 as a disadvantage. This is so funny!!!
Did you know that the 68000 has only 16 pins for his data bus ??? I suppose
yes, so you wanted to get an anti-Atari argument and got it terribly wrong :-)

So long,
Georges.

PS: I still have got no answer from anyone how the Jaguar's video memory is
organized, where it is, how big it is and how the data is put on screen...

Oh, God, here we go making things up again. Is that by any chance
Megabits Heiko?

Now check this out, and while I'm in non-flame mode I want the people
that read this to burn it to their brain:

THE FASTEST SPEED FOR A TRUE SCSI-II DEVICE IS 10MEGS/SEC.

|> By the way: someone has asked if the Falcon has "Wide SCSI". Of course NOT!
|> A "Wide SCSI" interface still costs more than $800 and I only know 3 HD drives

The speed I specified was for the best (wide) with a 4 Gigabyte hardisk.
This means the Falcon must be even slower.

|> Ciao, Heiko.
|> (zcam1121@rpool9.rus.uni-stuttgart.de)
|>

No flame Heiko, just a reality check.

CB> Last speed ratings I heard for the Falcons SCSI interface said it did
CB> something
CB> like 1 meg per second. If this is true than the A1200's IDE is faster.

Source? this is just another lie, when you can't think of anything better to
say.

The Falcon's internal IDE might do 1Mb/s (mine does 753Kb/s), the SCSI II does
(with OS routines) 4MB/s, and if you use the hardware directly, up to 7-8Mb/s.

CB> |> And `full' 32 bit should mean *everything is 32 bits wide. Is it? No.
CB> No, just the data bus, which in the Falcons case is not.

Source? That hasn't been proven yet. The bus runs at twice the speed of the
processor .. why?

The Falcon has been benchmarked against the 32-bit TT030 several times, and has
come out 50% slower - just as it should. (The TT is 32Mhz)

The Falcon has been benchmarked fecthing words against longwords. 0.05%
slowdown. (If it had had a 16 bit databus it would have been MUCH slower)

Why not accept the fact that Atari technicians knew what they were doing?

My brother's showing a interest in the Jaguar, and he would like more information if anyone has any. Does anyone know of an FAQ for the Jag please, or another source of information?

Thanx in advance!
Mark

I'm replying here because others may be interested. I keep all the Jaguar info on my .plan, so if you just "finger asmith@cypher.com" and capture, you'll get a nice bit of info!

>> So, Rickard: How wide is the 68000 datapath in the Jaguar?

>Hahahahohohohihihi ROTFL...

You have a terribly strange sense of humour, you know. You didn't
get the point at all.

>I have been waiting a long time before someone finally mentions the 16bit
>databus of the Jaguar's 68000 as a disadvantage. This is so funny!!!

Why is that?

>Did you know that the 68000 has only 16 pins for his data bus ???

Of course I do. And it runs a "64-bit console". So by the same
twisted logic that the master-genius Rickard Troedsson displayed up
there in the quotes, the Jaguar would be 16-bit.

>I suppose
>yes, so you wanted to get an anti-Atari argument and got it terribly wrong :-)

Well, first of all I didn't get it wrong at all. Second, I wasn't looking
for an anti-Atari argument (you don't have to LOOK for those anyhow). My
point was, that there's no point in arguing whether the sound chips output
data in 8-bit quantities, and try to belittle the system because of that.
Sound data is fetched in 16-bit quantities, anyway.

>So long,
>Georges.

>PS: I still have got no answer from anyone how the Jaguar's video memory is
>organized, where it is, how big it is and how the data is put on screen...

That's because nobody knows all those things. I only know that it's 2MB
in size, and that's the only RAM in the system (there is no separate
Video RAM).

You guys sould decide what you're comparing:

F030 - Cray in AMIGA case?
TT030 - Amiga 500?
MSX - Linux-box
or (that's what the subject says):
F030 - A1200?

So what does the Jaguar in this thread??

Because they weren't. They said 16-bit data bus, not the 32-bit you
want to imply. And about those 'benchmarks'... well, if we use Heiko's
original benchmarks we'll see that even a 68030 with a crippled
4-bit data path would do almost exactly the same in speed as what you
quoted above.

It has been proven Rickard, thanks to other objective ATARIANS here
that ran other tests, that the benchmark gain is just 'too generous.'
This points to the fact that the Falcon has a 16-bit datapath.

> People posted results from more informational benchmarks than yours
>Heiko. Definitively your benchkmarks were wrong.

The fact, that a specific benchmark is faster on a Falcon than on a A1200
doesn't make it wrong. You seem to have some trouble in accepting this...
If that benchmark was Falcon-specific, it maight have been a
not-so-good benchmark to compare the _overall_ performance of thouse two
systems. Feel free to write a benchmark at your own which tests EVERYTHING
a computer can do on both systems. Then it maight be a good benchmark, but
it could although be meaningless to somebody who doesn't want to do everything
a computer can do ;-)
Please don't say a benchmark is 'wrong' because you don't like it.

Want me to quote my Atari Falcon user's manual?
---
I will - the Falcon manual itself states 32/32 bus width.

---
RH> The Falcon CAN'T HAVE BURST MODE. DO YOU GET IT? Simple test for
RH> Falconites:

It CAN. If Atari uses a doublespeed bus and multiplexes the 16-bit words into a 32-bit buffer where the 030 reads the, it would indeed have burst- mode.
<more stuf deleted>
---

This makes sense to me as well. Don't forget also that the Falcon comes with burst mode enabled - lending further support to this theory. Why would it come enabled if it isn't used?

I have also seen another test over is c.s.a.st, that uses large matricies, a lot of floating point ops with no FPU usage. It also shows that the falcon is approx. 1/2 the speed of a TT.

It seems reasonable to assume that if a range of apps are run on a TT and Falcon, and the Falcon shows to be about 1/2 as fast all the time, that the Falcon has a 32/32 bus. Indeed, if these TT's have any fast ram of thier own, then the results show the Falcon somewhat above 1/2 speed!!

Now, if I can just get hold of a 68030 manual, perhaps I'll try running different tests with burst mode enabled/disabled. That should be somewhat conclusive...

P.S. - The Falcons SCSI speed is well above a mere 1MB sec, please don't malign a nice and very useful SCSI-II interface!!

Depends on the number of colours. I run my workbench in 720*534 non-intrelaced in 64 colours and there is no slowdown. I also have 4 megabytes of 32 bit fastram, which means that most stuff still runs at full speed even when the bus contention is very high. How much does the Falcon suffer from bus contention in 800*600*256 colours? (Can it do that mode?)

If you are talking about the effects of the CACHE then you are WRONG!,
it has not been proven that there is anything wrong with Heiko's
benchmarks.

I have tested this myself on several 'real world' applications and found
that the cache can in fact result in more than twice the speed of a given
task (such as compiling, compressing, decompressing data, etc) and even
significantly reduces processing time of any application.

I don't know where the information came from originally, but I can see
no evidence of a '16-bit crippled data bus' in the Falcon. If it is in
fact 16-bit, then they have compensated for it in some form or fashion.
This is based on personal experience using the Falcon for general
computing purposes, not based on any unrealistic benchmark.

well.. look...the 68000 has and external bus of 16 bits and an internal system of 32 bits. the 68000 is just the system controller in the jaguar. The graphics RISC chip is 64 bits, and I dont know what the sound chip is, but since it can do DSP I would assume its 16-32 bits . This doesnt make the system a 16bit machine: for the RISC chip can move data from the memory in 64 bit chunks. The 68000 is just a traffic cop.. but he isnt in the middle of the road! =)

MiNT was developed as multitasking kernel for TOS, but as the source has
been available for all versions, it seems some have ported it to other
platforms (whatever that might be good for).

>Can you still run TOS games, etc under Mint? Or is Mint another
>unix project that takes over the entire system, like Net-BSD68K,
>Linux-68K and AT&T SVR4?

No, MiNT replaces various TOS routines and adds a lot of new stuff. (That's
why it is the centerpiece of Atari's MultiTOS :-) ...) You will most
probably run into problems with games, though (it depends on the game, for
example NetHack runs just fine in a TOSWIN window under MiNT/MultiTOS; but I
doubt any of those action-games with lots of graphics and stuff will work).
(Actually I never tried that, as those games usually don't work with my
25MHz 68000 CPU anyway...)

# 2485. Atari - 040

Newsgroup: comp.sys.atari.advocacy
Date: 1993-10-31 17:38:00 UTC
From: rickard_troedsson@troed.ct.se
Message-ID: <2cd3f800@troed.ct.se>
Source record: 20836

People has been talking about the fact that there's no official 040 models of the Atari computers available .. lack of a decent workstation .. well .. if you really NEED a 040-computer .. take a look at this .. it's NOT an official Atari computer - it's a CLONE .. damn compatible though .. :-)

-/- Quote -/-

MEDUSA specs revised

o Motorola 68040 running at 32MHz (clock doubled, as usual)
o 8 Mb FAST-ram (up to 128 Mb on board) (uses vram for first 8)
o 32-bit local bus @ 32 MHz c/w 12 slots
6x100 way Medusa bus, 4x80 way Atari bus, 2x60 way memory bus
o 85 Mb/sec write to memory, 73 Mb/sec read
o 32-bit TOS 2.06 (slightly modified) running at 32 MHz
o Tower case
o benchmarked at 26 Mips/ 4.5 MFlops

Planned/Available expansions:

not planned o Graphics adaptor card
not planned o Motorola 68060 cpu card
planned o DSP card
available o SCSI-2 card
available o 16 bit VME card / Laser card (no - I don't know why you need a card for a laser printer)

It costs around 1400 UK pounds. I'm planning on spending around 2000 early next year on a computer, and this looks like the best way yet to keep my software investment :-)

-/- Quote End -/-

Now stop the "Haha, no 040-Atari thread" .. I reckon this to be one of the fastest 040 models you can get ...

I would like to see a Falcon040 RELEASED though .. (they do ofcourse exist as developers machines .. )

|> >THE FALCON? IT BLOWS IT AWAY.
|>
|>
|> Oh, come on mate, you **know** that is not true.

I ** KNOW** it is true. Maybe you misunderstood what I said:

>I CAN PUT IN THE A1200 WHATEVER I WANT TO MATCH THE FALCON'S PRICE IF
>I WANT TO COMPARE THEM. DO YOU GET IT?

This means that if I want to compare those two, I can put in the A1200
whatever I want which is 'non-standard' and extra-cost, and when I have
spent the same on the Falcon than on the A1200, then I start comparing them.
You can't compare as is two things that are so different in price, unless
the thing way below in price already does practically everything that
the more expensive solution provides.

|> You **cannot** bring up
|> the A1200 I/O to F030 standards without spending exactly the same,

Not the SCSI-II, granted. The MIDI, LAN and SCSI I, yes. And
you have a 50Mhz/50Mhz FPU machine too. This is also useful you know.

|> if not
|> slightly more than the cost of a basic F030. I know because I did the
|> calculation myself when trying to decide which to buy.

Where do you live then? Maybe where you live, not here in the US.
Here the A1200 is running now for $370 US dollars and I can get an
expansion with a 50 Mhz '030 with 4 megs FAST RAM for about $599 with a
SCSI port. Add a hardisk-> still below's Falcon's price here.

|>
|> The sort of statement you have made just discredits your own arguments.

No Xavier, read above.

|>
|> Now, lets be serious. SCSI, 16 bit SDMA, DSP, LAN, MIDI, 16bit ACD/DCA,
|> and so on are standard. There are the standard `PC' ports on the

|> A1200 as well as the option of multiple floppies, but really---the
|> F030 trounces all over the A1200 for features and *you* *know* *it*.

The A1200 that comes *AS IS* in those things you mentioned yes.

You don't mention on the A1200 that it has sprites, dual-playfields,
a copper list processor, a mature preemptive multitasking OS with
support for multiple languages, class datatypes, object oriented
graphic objects, video...?

I already said: Can I do what I do today with a Falcon?

NOBODY has answered that. I do it TODAY with Scala and Real 3D.

And that's okay, I mean, I will not say the Falcon is bad because
it can't do that. Now, that some people here imply that it can and
all that, is why I argue here.

|>
|> You agreed with me recently that the CPU != the computer and yet
|> here you are *again* concentrating on this one issue of CPU and RAM
|> access.

Here you are again concentrating on the 'Falcon specs'. What about
the support? The price? I think the Falcon looks nice for musicians,
in fact, IT IS AWESOME for that. I don't consider myself blind.

Now read to what I was replying and think about it. People want
to compare a machine that (at least here in the US) costs more than 3 times
the price on the A1200 and say it's superior. God, IT BETTER BE!
Then if price is not a concern for comparisons (and 3rd party options,
expansion and software-> from what people do here), why not compare
a Cray I gainst the F030?

|>
|>
|> Xavier

|> in the Amiga range.

I wonder what you mean by that...

|>
|>
|> The F'030 is not as good as it could be, but it's a lot better than many
|> of the alternatives.

A Falcon '030 is too expensive. Excellent for musicians, pretty bad as
a general purpose machine.

The last time ATARI really offered 'Power Without the Price' was
with the original introduction of the ATARI ST. (look that I said
*original* introduction of the ATARI ST, later on, their price/perf. went
down).

The Jaguar might be another one. The Falcon-> nope. A Falcon for
$700- (US)- with the 4 megs and a hardisk would look better.

|> > I wonder about the money exchange. But no matter how you whine, the
|> >A1200 continues selling like hell, the Falcon slow, and in the US and other
|> >places (UK) the Falcon still costs more.
|>
|> So what? The PC sells loads and loads. whats your point?

My point: people are comparing a machine that seems way in another
price category to another one. Don't you think that I could spend the
same amount on both and expand the lower price one if I want
to truly compare them? Don't you think?

|> >|> An A1200 owner came to my place yesterday (bought my SNES - Jaguar here I

Yep. Those Macs as a general purpose computer beat pretty much
everything. A friend of mine just bought the Quadra 610 and
definitively kicks butt. Finally Apple has made something
affordable. But this is for a general purpose machine.

I can see a Falcon being better for a musician and an Amiga for
a Video/Multimedia kind of guy.

Based on the definition of "True COlor" that I've heard, the answer is
"Yes". True Color means no palette.

>I don't know about that. A lot of clone Video card manufactures call
>16bit colour high-colour, while 24bit colours is true-colour.
>It seems that Atari supporters like calling the falcon's 16 bit video
^^^^^^^^^^^^^^^^
Not to mention Atari Themselves. Right in the "Choose Video" dialog and in
the manual, and anywhere where the 16 bit mode is mentioned it's called
"True Color" If this was technically wrong or in breach of some copyright
I don't think they'd do it...

Is the out-of-the-box F030 faster than an A4000? No. Is the out-of-the-box F030 faster than a Cray XMP-1 or than a Connection Machine? No.

Ah, but the Falcon is cheaper right? Same with the A1200.

Spending the same amount of $$ on an A1200 at a Falcon Level surely gets you a faster machine (except for specific DSP stuff).
---

I'm not so sure about that anymore - the falcon price appears to be dropping.

---
|> A comparison of AmigaDos and MultiTos is called for. I would get on and do
|> it if I had time.

Is MultiTos cooperative or preemptive? Didn't Flip hinted that MultiTos was a hack? Non-optimized, etc? The only thing I envy from the Falcon environment is the way Gem makes the graphics so they are, like the Mac, easily 'retargateable.'
---

Multitos is fully preemptive, and is almost completely POSIX compliant now as well... It is not a hack, and coming from a world of UNIX programming I really like MTOS and all of the features it offers.

**YAAAAAWWWWWWWWNNNNN**

Now we are discussing the merits of CLI!!! Wow, if you look over in comp.sys.amiga.advocacy you will see a group of Amiga users saying how useless CLI's are and how only GUI are worth anything (I do include shell programming in CLI debates).

BTW, tcsh, ksh etc are mighty fine shells to use. Of course I realise that nothing on this planet, not even a CLI developed and used on loads of UNIX machines around the world could ever occur to the offerings on an Amiga. I would be crazy to think otherwise.

Close, but not exactly. "True color" in X implies a decomposed index
for R, G, and B (i.e. each base color has a separate index).
Therefore, you have 3 (static/read only) colormap, for each R, G, B.
Normally the index value for each base color has a direct
correspondence to the intensity of the color on the screen. However,
the colormaps usually contain Gamma correction to take in account of
how humans perceive color and light at different intensities.

No where did I say about the size of the colormaps. Therefore, "true
color" refers to any size implemented in the above fashion.

BTW, "direct color" allows the programmer to insert his/her own
values into the colormaps (read/write colormaps).

It's not what is cheaper, it is whether the machine does what you want.

Or has everyone forgotten that we use computers, but don't worship them?

> Spending the same amount of $$ on an A1200 at a Falcon Level surely gets
>you a faster machine (except for specific DSP stuff).
>

Which still may not run the software packages some of us might want to run.

I refer to the latest issue of Keyboard Magazine. They claim the Mac and PC
have arrived as MIDI machines, and the *Falcon* is still strong and has
lots of promise. The Amiga? They said it was too far behind in terms of
software.

This is not hype. This is from a magazine musicians would listen to.

Given this kind of impression throughout the music world, why would I want
an Amiga?

>|> A comparison of AmigaDos and MultiTos is called for. I would get on and do

>

MultiTOS' only flaw is that the AES has not been totally redone to multitask
as efficiently as it *could*.

I've used the Falcon. I'm buying one December 4th with my new VISA card
because I've tried the machine, tried the software, and I like it. I have
also tried the Amiga 1200 and because I have to pick between the two, I am
buying the one which gets the job I want to do *done*.

You do video work, so stick with the Amiga. But don't flame the Falcon just because Rickard pisses you off.

A soon to be Cubase-Audio owner,

FLiP

(some of you might ask what I did instead of getting an A1200? Easy? I bought a Korg Wavestation EX for my setup. Slightly more interesting than than an 8-bit sound chip, don't you agree? :) )

I guess that explains where it all comes from them. Atari Themselves
haven't got a very good record of telling the truth. They were recently
found guilty of running a campaign likely to mislead and deceive
reasonable readers by the Advertising Standards Council (of Australia).

I've always taken everything Atari have said with a grain of salt ever
since Sam Tramiel said that the Atari ST outruns an Amiga 1000 by a factor
of three times for certain applications. I could never figure out what
kind of applications he was talking about.

Below is an excerpt of their findings.

---

◆ Area: AUST_AMIGA ◆◆◆

Dear Sir,

Re: Tandy Electronics - Print Advertisement

I refer to your recent letter in which you made a complaint about the above advertisement.

Council met on the 8th September, 1993 and determined as follows:

The complaint was considered by the council at the meeting on 14th July 1993 and deferred as follows:

The Council examined the advertisement and considered the responses to the complaint, received from the advertiser, its advertising agency, Atari Computers Pty Ltd (supplier of the featured product), Atari's advertising agency and the newspaper which had published the advertisement.

The Council did not consider that the evidentiary material submitted by the respondants was such as to enable it to make an objective determination of what was a technical & complex complaint.

The Council resolved, therefore, to further its inquisitorial processes by seeking comments concerning the advertisement from Commodore Business Machines
Pty Ltd., whose Amiga 1200 computer was unfavourably compared with the advertised Atari 1040 STE.

At this meeting the council again considered all of the evidentiary material before it on the previous occasion, together with a detailed response provided by Commodore Business Machines Pty. Ltd. on 18th August, 1993.

Whilst the advertisement was clearly of a comparative nature, the council considered that on the information provided to it by Commodore in relation to the Amiga 1200 personal computer, the comparison was presented in such a way that the advertisement was not only likely to mislead & deceive reasonable readers, but also disparaged the Amiga 1200 in an unfair and misleading way.

Commodore's response (in part) stated that:

"FACTS THAT ARE WRONG

Atari in advert: Amiga in Ad: Actual Amiga 1200
=============== ============ =================

Programmable sound Blank Programmable sound
generator generator

5 channel stereo sound Blank 4 channel stereo sound

DOS compatible Blank Compatible via optional s/ware
(MS-DOS assumed.
this is an optional
piece of hardware &
software on the Atari)

MS-DOS Format disk drive Blank MS-DOS Format disk drive

FACTS THAT ARE MISLEADING

Atari Amiga 1200
----- ----------

Ad: 68000 series 68000 series
Actual: 68000 68EC020

The processor chip inside the computer can be considered the heart of the system. While both machines use a processor from the same family and manufacture, the later model (68EC020) has several times the performance of the original (68000).

Ad: Cartridge port Blank
Actual: Cartridge port PCMCIA card/cartridge port
(proprietary port) (industry standard)

Both units have a port which enables games to be loaded into the computer in the same manner as a sega games console. On the Amiga the port is more often used to add memory to the system. Often it is cheaper to supply games on computer disks than on cartridge.

OMMISSIONS

While this section could be debated and expanded at length, there are a few points that must be mentioned to make the comparison fair at the price points noted.

Atari: A1200:
------ ------
No hard disk ($900 to install a 40mb hard disk included 85mb
hard disk (Aust Tech P/L 03.894.1652)

Apparently Atari no longer make a hard disk for the 1040STE. They directed me to a company called Aust Tech.

Atari: A1200:
------ ------

Processor has to do all Has a graphics
graphic functions co-processor to speed
up graphic performance

This is a major feature of the Amiga that sets it apart from other computers. The inclusion of such an accellerator significantly speeds up the computer by freeing the machine to run programs rather than look after updating the screen."

The Council observed that there are many benefits to consumers of factual and informative comparitive advertising. Unfortunately, no such benefits applied to this advertisement in that it was neither accurate nor a fair comparison, on a feature to feature basis, of the similar properties of the compared products.

The Council determined therefore, that the advertisement was in breach of the Advertising Code of Ethics and in particular, Clause 7. and 11. which state:

7. Advertisements shall be truthful and shall not be misleading or deceptive.

11. Advertisements shall not disparage identifiable products, services or competitors in an unfair or misleading way.

The complaint was upheld.

Whilst this Minute has been settled by the Chairman, it is still subject to confirmation by the Council at the next Full Meeting. In the event that there is any change in the content of the Minute you will be advised accordingly.

Yours faithfully,

<signature>

Colin J Harcourt
Executive Director

STacy is the older version of the Atari-Notebook. The new model is called
STBook.
Two years ago Atari presented a prototype of the STPad - a ST-Pen-Notebook.
Atari has dropped the development of this Pen computer (which was a wise
decision).

Yes. HAM8 is nice for static pictures. END OF STORY.
For animation, limited, and for other applications such as morphing, the mode is ok for displaying results. That is it.

Falcons proper 16-bit true colour mode (true colour - hardware process for reproduction of colour) mode
is far superior for animation, and said applications.

Well, I guess it is the same reason as we have Mac emulators on the Atari.
For fun... ;-)

For one thing a little POSIX compliance wouldn't hurt.
But there are a lot of things you get with MiNT such as mountable
file systems, and adjustable process priorities that System 7 just
does not seem to support.

But my best guess is the same reason Eric wrote it in the first place.
Someone just wants to do it.

Brian

MiNT detects whether or not an MMU is available and does memory protection only if hardware support exists. You can permanently disable memory protection by renaming MiNT.PRG to MiNTNP.PRG.

|> Doesn't Unix require memory protection?

Technically No. But VM support will be worthless.

How can they get Memory Protection on a 68000? I thought only the
68030 and 68040 had inbuilt mmu's (on some), with an extra support
chip required for the 68020 implementation.

Doesn't Unix require memory protection?
------------------------------

MiNT can be used with memory protection on or off, and you are right
that you can't have memory protection on anything less than the 68030.

|>
|> The programs shows 504K colors using a 24bit palette.
|>
|> That is more than HAM8.
|>
|> It looks INCREDIBLE! (YES it looks better than the normal Falcon TC)

Aha, yeah. The moon is made of cheese and I got a 16-bit 16-voice
sound player for my Amiga that uses only 25% of the CPU time.

And the Earth is flat...

So, how they do the 24-bit palette? How they do the 504k colors?
You know, 640x400 is only 256,000. What resolution? 800x600? Sitll 480,000 colors.
Hmmm.... someone is lying.

But anyway, so what is it? Artifacting a la Atari 8-bit Graphics 8? Dithering?
Flickering screen consisting of two interleaved screens like Quantum 4096 color
paint for the ATARI ST?

Looks like you just read the README file.... Someone else in this forum
with better credibility that Rickard explain what actually happens?

Kendall? Flip? Xavier?

I haven't. BUT SOME PEOPLE AROUND HERE SURELY HAVE. And since they are
on the subject on COMPARING THEM, and TRASHING THE A1200, I just want
to raise some points for a FAIR comparison. Now, this is not all the people
in this group, but a good majority of them.

|>
|> This is not hype. This is from a magazine musicians would listen to.

I belive you. I have read that magazine too, and Electronic Musician, for
that matter. No problem here pal, tell that to your other fellow ATARIANS
around here though. The Amiga for example has become pretty much Queen
of the Video market, with a large foot on the multimedia market.

|>
|> Given this kind of impression throughout the music world, why would I want
|> an Amiga?

If you like music, GO WITH THE FALCON. SEEMS AN EXCELLENT MACHINE FOR THAT.

Are you surprised? I consider myself objective, now check out the postings
of some of your fellow ATARIANS.

From: saj@chinet.chinet.com
Message-ID: <CFvqEI.KKL@chinet.chinet.com>
Source record: 20749

What we're probably seeing here is a stockbroker who has trouble with the hair-thin distinctions we Atarians are used to. Atari may well be producing no computers this week. If so, it's certainly because they want to get everything they can behind the Jaguar launch. Also, there's no telling what they'll be doing week after next.
Even though the course of action described seems to make good business sense, I get a strong impression that several members of the Tramiel family hav a need that transcends logic to be in the computer business.

Steve

There is no problem, doing animations in HAM8, so why is 16-bit
true color superior (except it can be word-accessed) and tell me
some applications except presentations that need 65xxx colors ??
Perhaps games ? Then buy a PC .....

Stephan (an A4000/040 user, who liked to by a falcon

Yes games. Now dont go all serious on me
' I bought my 1200 for serious applications etc'
YOU SHOULD HAVE BOUGHT A PC.

Most amiga users own their machine for the simple reason that it is
or they hoped it to be a good games machine, or to put it amother
way, they spent their money on Commodores 1200 for enteraintment.

HAM8 needs a lot of tweeking and cpu work to look half respectable.
It is not a straight forward graphic mode. The 16-bit falcon mode
is a conventional graphicc mode, and has no administrative overhead.
HAM8 does.

Commodore weren't stupid when they placed it into amiga machines, it has it's
uses, amoung them lovely static reproductions, and digitising, and maybe
small amount of animation. Certanly not for full screen animation.

I state again, yes, there are difficulties forcing HAM8 to animate.

Now please, open your mind and accept the bloody truth.
HAM8 IS NOT SUPERIOR ,WITH RESPECT TO ANIMATION AND ACCURATE REPRODUCTION OF
COLOURS, TO A 16-BIT CONVENTIAL TRUE COLOUR MODE.

> Stephan (an A4000/040 user, who liked to by a falcon
> but talked to some small-brained developers

} have been to used to vaporware Rickard.
}

Hang on a sec - these aren't vapourware. People are actually using them...

Lexicor have ordered one, Application systems have got one... Quote follows:

Application Systems Heidelberg (they sell Signum 3.3m, Papillon, Phoenix, Magix) sent a new newsletter to their customers.
Application Systems Heidelberg wrote:
We've waited long for a powerful computer for Atari-software. Medusa T40 is its name and since the last week of September we know what it is like. In August we sent a board of an old Mega ST2 to Switzerland and a month later came a computer-tower back with 68040 CPU (64 MHz) and 8 MB Ram.
...A TT is one of the fastest Ataris an it took 150 seconds to morph a picture. The morphing on the T40 was finished in 30 sec. This was quite impressive and five times faster.
Qoute ends.

Now it is true that this is not made by Atari, but they get the ROMs from Atari, and the O/S is the same, and the peripherals work etc. etc. Basically it's a clone. But then - when we say PC-compatible it doesn't have to be made by IBM to get the "seal of approval". I think it is valid to claim this is an 040 Atari.

Simon.

|> Yes games. Now dont go all serious on me
|> ' I bought my 1200 for serious applications etc'
|> YOU SHOULD HAVE BOUGHT A PC.

I can`t see that this is a 1200 discussion: It`s a HAM8 !!!
discussion (at least this part of the 1200 discusssion)
So, HAM8 is also used in an A4000 and I thought, people
who write articles can read, but I was wrong
(I do NOT NOT NOT own an a1200 !!!)
I think for games you should by a PC or even better a Jaguar/3DO,
but NO CD32/1200 !
|>
|> Most amiga users own their machine for the simple reason that it is
|> or they hoped it to be a good games machine, or to put it amother
|> way, they spent their money on Commodores 1200 for enteraintment.

I still can`t see the point, we talk about HAM8 !
|>
|> HAM8 needs a lot of tweeking and cpu work to look half respectable.
^^^^^^^^^
One question : Did you ever see an JPG pic in HAM8 ???

|> It is not a straight forward graphic mode. The 16-bit falcon mode
|> is a conventional graphicc mode, and has no administrative overhead.
|> HAM8 does.

Yes, HAM8 does, but I can`t remember programms on a Falcon
except demos that use 16 Bit (no games etc., perhaps because
I didn`t see any game ...)
|>
|> Commodore weren't stupid when they placed it into amiga machines, it has it's
|> uses, amoung them lovely static reproductions, and digitising, and maybe
|> small amount of animation. Certanly not for full screen animation.

I always hear small amount of animation : YOU CAN DO FULL SCREEN
ANIMATION FROM HARDDISC !!! Animations use the Anim file format and

it doesn`t matter wheater the pic is HAM8 or 8bit 256 colors
|>
|> I state again, yes, there are difficulties forcing HAM8 to animate.

Come, watch some raytracing animations and tell me this again.
|>
|> Now please, open your mind and accept the bloody truth.
|> HAM8 IS NOT SUPERIOR ,WITH RESPECT TO ANIMATION AND ACCURATE REPRODUCTION OF
|> COLOURS, TO A 16-BIT CONVENTIAL TRUE COLOUR MODE.

YOU said 16-Bit is superior and I don`t think it is.
For animations, pics, presentations etc. HAM8 is better, for games etc.
true colors are better.

HAM8 more than 754000 colours out of >16.7 Mio colours
16 Bit 65536 colours out of 65536

What`s better ? And to this "True colour" thing :
I think 24bit is true colour, 16 bit is NOT (just because
there is no palette, you don`t have TRUE COLOUR !!!
because an old C64 doesn`t use a palette, too)
|>
|> > Stephan (an A4000/040 user, who liked to by a falcon

A majority of the postings around here are made by rabid A1200 owners who feel
compelled to defend their platform against the only other company whose
computers are on a sinking ship. :) This has been getting pretty pathetic...

I'm wondering what the next criteria for comparison will be between the two?
How many users are weenies with no life?

(obviously a good platform would be so alluring to the end user that he/she
would forget than anything else BUT their computer existed, and become a
true weenie... if that is the case, I submit for everyone's approval that
Peter Sinclair is proof that the Mac is the superior platform...)

> Music. That's it.
>

Does a musician need anything else?

I just had an incredible eye-opening experience going with my sister and her
husband to pick their new computer. He's a doctor and he's running a video
business. The guy they had doing titling for them was an incompetent Amiga
owner (i.e., he doesn't know the full power of the platform and hence, they
have a bad impression of it due more to his stupidity than the machine's
failings... he was trying to do serious video work with NO HARD DRIVE, a
DCTV, and 5 MB of RAM.).

At first we checked out killer machines with killer video. Those who say you
can get a nice clone for the price of a Falcon or A1200 need to go to CompuUSA.
The system most of us would "want" with a PC will cost about $2000 with just
4MB of RAM and a 200-300MB HD. For $1200, you can get a 486SX/33 with 4MB
and a 170MB HD. Same price you can get a Falcon 4/84, and when you start
looking at what is standard and what you can do out the box with bundled
software, most of these clones fall on their faces.

(case in point, legitimate software costs big money... WP 6.0 is $300 at
CompuUSA)

They dismissed the Mac out of hand. Dismissed my wonderful Atari, too.
They wanted a PC. What will they wind up with? Probably a 486/33 and by
the time it is decked out with a 15" monitor, 210MB HD and 4MB of RAM it
cost roughly $2000.

<and the monitor isn't anything more than a CompuDyne.. hardly expensive...>

Now, here's the crux of my point.. do you know what they are spending this
money for?

A computer so she can use Word Perfect (latest version not out for Amiga OR
ST), and so he can use a spreadsheet (preferably Lotus-like) and do some
DTP (as if the ST or Amiga couldn't).

Do you know what they will most likely wind up with? A PS/1 DX2/50 for about
$1800 sans monitor with 4MB of RAM and some bundled software. They'll need to
tack on Word Perfect and some other goodies.

So all of you (Atari and Amiga users both) can evangelize all you want, but
talk is cheap. Even if Raist convinces everyone in the Atari market to go
Amiga, they'll just wind up with a couple hundred thousand (in the US alone)
pissed off MIDI users.

>
>|> (some of you might ask what I did instead of getting an A1200? Easy? I
>|> bought a Korg Wavestation EX for my setup. Slightly more interesting
>|> than than an 8-bit sound chip, don't you agree? :) )
>|>
> He he. But soon you'll want to make a video of your music, and then
>you'll end up with an Amiga too :-)

But the music would have sucked without the Wavestation EX. :)

(imagine this... dual digital effects processors... and it's 32 oscillators,
which means up to 32 voices at once (although the true power of it is
used in 2 and 4 oscillator patches, these can be mixed with 1 oscillator
patches to get more than just8 voices at once... a truly beautiful box...
I still want another new synth before I buy an Amiga for video... :)
(probably a Wavestation A/D) )

As for the video, there may still be an A1200 in the future, but I've heard
about an SGI box (INDY) that runs $5000. Any comments from the peanut
gallery on this vs. an Ami?

(given that kind of pricing + software cost)

I would agree with that in the sense that Atari has stated it is going to
concentrate fully on the Jaguar. I beleive this is the appropriate action
to be taking, as well as the fact that they have always been up front in
saying that the Falcon and the newer lines of computers are not their main
priority as of now. But they have also stated that they will use the revenue
generated from Jaguar sales to help finance the falcon at a later date. I
do not beleive this will be an indefinate suspension of computer manufacturing,
but rather a good business move for the time being...

> is a conventional graphicc mode, and has no administrative overhead.
> HAM8 does.

You look a bit confused here. Displaying a HAM8 picture is easy, and does not need any tweeking, and very few CPU time. HAM8 can be considered as a lossy compression scheme: you need some time to compress the 24 bit picture, and there is a slight (yes, really slight) loss in quality. But the decompression is extremely fast, and the CPU is not involved.

> Commodore weren't stupid when they placed it into amiga machines, it has it's
> uses, amoung them lovely static reproductions, and digitising, and maybe
> small amount of animation. Certanly not for full screen animation.

I am the owner of an Amiga 4000 for 11 months now. HAM6 never really convinced me on my old A500, but I have to add that HAM8 is a lot better, especially combined with the other enhancements of the AGA chipset.

Talking about static reproductions: the A4000 can open a 640x495, 60 Hz HAM8 screen, non-interlaced. If 72Hz interlaced is no problem, the AGA chipset can diplay pictures at a respectable 800x600 (more with overscan). If I remember correctly, the Falcon is unable to diplay a non-interlaced 'True-color' picture at these resolutions. So: the Falcon has less colors and less resolution. The fringing is no problem, if you can afford the time to convert correctly the 24 bit picture to HAM8 (once this is done, the picture can be displayed very quickly).

> I state again, yes, there are difficulties forcing HAM8 to animate.

You do not need to 'force' HAM8 to animate, because it is perfect for the task! HAM8 is easy to animate, and can be very fast (even full-screen) if you use the right ANIM standard (either ANIM7 or ANIM8). How much frames/second can you play out of RAM on a Falcon in 'True-color' mode?

> Now please, open your mind and accept the bloody truth.
> HAM8 IS NOT SUPERIOR ,WITH RESPECT TO ANIMATION AND ACCURATE REPRODUCTION OF
> COLOURS, TO A 16-BIT CONVENTIAL TRUE COLOUR MODE.

Well, I hope it don't hurt you if I say that you do not seem to know a lot about Amiga graphics. HAM8 would be difficult to use in an action game, except maybe for some backgrounds. But for art, ray-tracing and animation, HAM8 is a fast and excellent solution. What is more, there are good animation packages on the Amiga that use HAM8 to its best.

Well, I'm not on Raist's list of "credible" people, but I am in the process of translating the source code into english. The french is not much of a problem, but the assembly's tough. :) Anyways, I've tried it out, comparing some JPEGs that I have noticed the 16 bit limitation on, and they DO look much better using the VIDEL viewer. No, the image is not interlaced unless the resolution requires it (I;'m using my Multisync in SC mode, I'll try it in VGA soon) and it seems to be running quite stable with a decent refresh rate. It definitely uses moer colors than 65000, but I'm not sure about the 24 bit palette part...

# 2532. More final 1200/Falc words...

Newsgroup: comp.sys.atari.advocacy
Date: 1993-11-04 06:26:20 UTC
From: aspect@cats.ucsc.edu
Message-ID: <2ba7ac$mhb@darkstar.UCSC.EDU>
Source record: 20765

Well, I just got through speaking with a former A1200 owner who explained to me the reasons why he sold it in favor of a Falcon. To be honest, he was an Atari person before who got a 1200 instead of a Falcon in order to "check out the competition" as he said, but switched back because (again in his words) "it fell flat"

Nit-Picky reasons for F030 over A1200:
A1200 has an external power supply like the old 520. "What? I have to bend over to turn it on?"
Same sound as the Amiga 1000, pales in comparison to F030
No built-in clock
No DSP
No High Density Floppy drive
No built-in fan

A lot of these are quite nit-picky (hence the title) and there are those who doubt the importance of the sound system and DSP (but isn't DSP decompression of a JPEG image 5 or more times faster than sftware decompression something even a die-hard VIDEO VIDEO VIDEO Amiga person would like?)

Second, we talked about the OS from a user's point of view, and having spent some time recently meself using a 500 with 3.0 workbench, I still say that the GUI looks like a joke. Quite superficial and subjective, but when I sat down at it, I felt like I was using an "afterthought" gui instead of an integral part of the OS! Anyway, both he and I concurred that the user's viewpoint of the Atari OS (especially Falcon / MTOS) is much better than that of the Amiga OS.

Third, he mentioned an article in an Amiga magazine where Thalion, a software developer who made the AmberStar and upcoming Ambermoon games, was asked how he felt about the A1200 being able to handle the next generation of game software. According to the article, Thalion really wished that the A1200's graphics were more like the Falcon's, and that he was very inpressed by the abilities of the Falcon's DSP.

Lastly, we tried to discuss HAM8 graphics. I said "tried" because neither he nor I understand technically how it works, and neither of us are hardcore artists (in fact, I'm red-green color defective) but he said that most of the HAM8 pics that he downloaded were only in the 75,000 to 100,000 colors used range, and than the ones that did use close to 200,000 colors showed signifigant "fringing" as he called it, which I undertand to be the distortion of the color caused by the inherent limitations of HAM8. He also said that the 16 bit true color inages he saw on the Falcon looked just as good as any HAM8 pic he saw on his A1200. He also mentioned that if you modify a pixel in a HAM8 picture, it tends to also modify those pixels around it. THis makes sense based on the "Hold and Modify" premise as my limitedknowledge goes, and

I ask those who use HAM8 for "professional" graphic work, even though HAM8 might be debatably better for viewing an image, for actual creation or modification of imagery, isn't it really undesireable to not be able to (for example) put a blue pixel in the middle of a black area without it lining itself with green pixels too? (just a very hypothetical case. As I said, I know next to nothing of how HAM8 works)

for PHoto retouching (isn't this a professional area?) wouldn't even the "limited" 16 bit true color be better than HAM8? Can you do tints, blends, lightening & darkening, blurs easily in HAM8? I know you can in True COlor.

ANyways, I've wasted enough bandwidth with this long post... Corrections are of course welcome, but flames will probably be ignored.

ha ha.
Animation from harddisc. You are absolutly correct...

However, what you are talking about here is whole screen dumping from
harddisc, each a frame of animation. Now that's just silly.
If I had a large harddisc, and some nice raytracing software (and
a lot of time) then maybe I too would use this option.
I agree then that you could use the harddisc for that purpose, but
what about 1200 users with no harddisc.

Also, the frame rate couldn't be very high, and we're talking mainly about
slide shows and nice ray-traced sequences. You could also probably do
segments of screen animation, saving space and cpu, but the hassle...

Now you must agree with me here: for software that uses the cpu and
conventional approaches to animatio, and by animation, I mean animation
found in games, demoes, etc, without the brute force applied by the
harddisc to screen effort, HAM8 is slow, ugly and hard to administrate.

HAM8: nice if you have a slide sho or a 100MB haarddisc.

> Come, watch some raytracing animations and tell me this again.
I'm sure it would be lovely to look at.

>|> Now please, open your mind and accept the bloody truth.
>|> HAM8 IS NOT SUPERIOR ,WITH RESPECT TO ANIMATION AND ACCURATE REPRODUCTION OF

> YOU said 16-Bit is superior and I don`t think it is.
fair enough.

> For animations, pics, presentations etc. HAM8 is better, for games etc.
For animation, maybe with regard to brute harddisc to screen (very clumsy).
But not for conventional computer animation (see above)
I agree that HAM8 is nice for static pics, but so too is a 16-bit mode.

AND HAM8 takes a lot of work and tweeking to look decent.

> HAM8 more than 754000 colours out of >16.7 Mio colours
> 16 Bit 65536 colours out of 65536

> I think 24bit is true colour, 16 bit is NOT (just because
> there is no palette, you don`t have TRUE COLOUR !!!
> because an old C64 doesn`t use a palette, too)
Brick wall again.
Before you come back to me on this one, please look for some
computer architecture text, look up palette techniques, and search
for the term true colour.
I'm not talking about the misinformed view of true colour as
'near infinite colour range' or 'copyright joe bloggs',
I mean true colour as a colour reproduction technique. ok?
Each colour gun is given a value, andd IT generates the corrent
frequeny from that directly. There is no look up table in the
palette chip. The 16-bit pixel is broken up into it's red,green and
blue parts, and handed directly to the colour guns.

Using this technique DOES NOT ENSURE A INFINITE COLOUR RANGE; DOES
NOT MEAN WE ARE TALKING ABOUT 8,16,32 BIT COLOUR ( COLOUR REPRESENTATION
INDEPENDENT).

All it means is that colour reproduction will be more acurate and 'true'.

please....

^^^^^^^ sorry for that ....

|> ha ha.
|> Animation from harddisc. You are absolutly correct...
|>

Because Animations from HD are more difficult than animations from
the RAM (speed) i mmentioned the HD. But shure you can do
animations from RAM

|> However, what you are talking about here is whole screen dumping from
|> harddisc, each a frame of animation. Now that's just silly.

Anim7 doesn`t dump a HAM8 pic to the screen, the pictures are
packed and there are only the differences between two pictures saved.
(Don`t ask me for details, there are that many differnt routines...)

|> If I had a large harddisc, and some nice raytracing software (and

OK.
It seems that clever clogs out there have put HAM8 to good use.

I still maintain that for hassle free, straight-forward animation/pics that a conventional screen mode (16-bit) is, should I dare say, better in most regards.
Now, you can get some real ace pics from the Falcons 16-bit mode. I've seen some myself, a bowl of friut you could almost touch...

HOWEVER, with the know-how, HAM8 on an a4000 seems to deliver the goods.
You've convinced me.
I can see where compression, a HD, and a 040 could really make HAM8 worthwhile.
Happy?

But on a 1200... :-)

And, let me say, that no matter how much we debate, even IF the falcon has better hardware (I think so anyway) ,if the 1200 or any other computer with comparable but inferrior capabilties ( :-) ) has much better software, then the falcon is worth shit!

The Falcon could be the best home computer EVER, and never take off without good software.

What is this 'afterthought' rubbish? The Amiga does not run without a GUI. It's on ROM for goodness sake.

NO NO NO NO NO! The technique of producing colour by specifying RGB values
directly on a pixel per pixel is called DIRECT COLOUR. *True colour* means 24 bit.

There is really nothing clever about that. It's just Delta-pack animation which is a technique that is YEARS old (anyone still use Cyber Studio?). We use it in our motion video digitiser - it's dead easy to implement - an 8MHz 68000 can do it perfectly well without any clever-clever Demo Programmer hacks.

Now, perhaps MPEG would have impressed me.....but maybe not, we've already got that on the Falcon - using the DSP to unpack it so the CPU time needed is, shall we say, minimal :)

> The animations from HD are "fliessend" (at least 25 fps)

24-Bit True Colour was actually bandied about by some company or another as being able to run the electron guns in a VDU at such an accuracy as to be 'perfect' to the human eye.

True colour in terms of computer architecture, simply means that there are no palette look-up registers which map screen colour codes into actual values for the electron guns. The information comes soley from the screen memory.

ok, here's the question that killed GEMulator :) so I'll ask this for the
Amiga's ST emulator:

Does it run the MIDI software? If it can, what packages are known to work?

And most importantly, can it use a hard disk?

(And what revision of ST roms does it use? 1.0-1.4 don't support anything
but a 68000, and 1.6-up support everything beyond....)

I mean that it LOOKS like an afterthought. No real concept as to what a GUI
should look like, just "well, it has windows & icons, is that enough?" sort
of approach. the fact that it is on ROM makes no difference...

Since I got many replies on my last "Falcon 24bit letter" ... here's another one.

Douglas little/BSS wrote in February -93, a program called "View 24b" ... he claims it does 16.7 Million colours from a 24bit palette ...

Has anyone checked it out? On my TV it seems to give better results than the Videl Viewer actually .... and ALOT better than the normal 16-bit Falcon TC ..

The program is about 3K .. Email me if you haven't got it .. (it's an old program, surely it must be widely spread!?)

Get the AEO Special-Edition called aeo_se_j.zip from the ftp site
atari.archive.umich.edu (folder: atari/Magazines/Aeo) and read.
Please, don't start this 64/32 bit discussion again!!

Ciao, Heiko

Sorry, but calling 15/16 bit colour True Colour is just marketing drivel, which
Atari seem to be doing more and more of these days. It's like calling the Falcon
32 bit, the jaguar 64 bit, Intel claiming rediculous MIPS ratings for their
processors and windows graphics accelerators that have hardware designed to spot
benchmarks and return erronious results. It's a deliberate and cynical
manipulation of the 'facts'.

32 bit colour is usually 24 bit + alpha channel. Some workstations are now using
48 bit colour, and maybe this should be called true colour as well, who knows?
But calling something true colour just because there is no CLUT is stupid,
because this would then apply to a monochrome ZX81, or an Amiga displaying a 0
bitplane screen (ie black).

Is this the same GEM we're talking about here? the one I saw on the ST looked like a CGA effort, or something from a C64 (no offence to C64 owners, I used to have one myself). Are you actually aware of how customisable the look and operation of Workbench is?

Windows, Icons, Pull down menus, cycle gadgets, radio buttons, file requestors, screenmode requestors, font requestors etc etc.. All these things have a standard look and feel (not everyone may use it, but that situation is improving) IMO Workbench is one of the most 'solid' looking GUI's around. GEM just looks cheap and nasty, Windows *is* cheap and nasty, X windows is probably my favourite GUI (Because it's even more customisable than Workbench) and I would probably place

the Mac GUI somewhere around the same level as Windows (It's slow, akward and messy)

Why is this stupid? Atari's definition of True Color is a good
definition: The bits that represent the pixel represent the True
Color of that pixel as opposed to being a pointer to a CLUT. Hence,
they call it a True Color Mode.

By that definition, the ZX81 has a 1-bit True Color mode and the
Falcon030 has a 15/16-bit True Color mode.

Another good term that I've heard recently is Direct Color (for True Color modes) and Indirect Color (for CLUT based modes).

To me, it's much more compact and elegant to decribe all the different video modes using as few terms as possible. In other words, it's better to say 16-bit True Color and 24-bit True Color as opposed to inventing new names for each case (i.e. HiColor and TrueColor).

In this way, you don't have to invent a new name as technology improves. All you do is append the number of bits (i.e. 48-bit True Color).

And there's nothing wrong with having a definition include degenerate cases such as the 1-bit True Color mode. In fact, lots of mathematical definitions have these so-called degenerate cases.

The fact is the Atari Falcon has a 32-bit CPU. It is a 68030, which I might
add, a processor that is "one step up" on the Motorola totem pole from the
one in Commodore's "base machine", the A1200, which we all agree is 32-bit.

The Jag has a 64-bit graphics system, a 32-bit DSP/sound system, a 68000
for a purpose YOU don't know jack about because you don't own one, nor do
you have any knowledge of it, and yet you flame.

This is ridiculous.

Just because someone claims HAM8 is useless (an argument against the A1200 that
I disagree with... HAM8 is quite nice, and could be used for pretty much any
use that a real 24-bit mode could be used for, though perhaps some concessions
may have to be made, if any, for its method) doesn't mean you should flame
away without thinking and make stupid comments like that.

Go find me a 16-bit 68030 and I'll retract the above.

("But Flip", they will say, "the Falcon only has a 16-bit path from the CPU to
memory! That makes it 16-bit!"... but if that is the case, when did Motorola
claim the chip was like the 68000... a 16/32 chip, huh? Do 68030s suddently
become 80286s and 68000s when they are on a 16-bit bus? Does the Amiga's
16-bit Blitter cripple it? Does anyone care?)

Subjective opinion follows:

I've used the Falcon AND the A1200. Both are fast. The A1200 is a bit faster
in its native GUI when MultiTOS is running and this "look & feel" test I did
was when a Falcon was in True Color mode and the A1200 was in a 256 color mode.
Both were doing 80 column displays. When I say the 1200 felt a bit faster,
the only REALLY noticeable thing was that the pulldown menus came down a little
quicker. The desktop, which on the Amiga was pretty barren (the Falcon was
running on a network at Toad Computers) refreshed about the same speed..
There was no major perceptible speed difference.

Chris,

I relish telling you this... Look at what you typed.

GEM looks cheap and nasty. Sure. Right. Subjective opinion....
Windows *is* cheap and nasty.

then you say:

X is my favorite GUI.

First of all, X is NOT a GUI.

Second of all, if you do use a GUI under X, if you're using Motif, Motif
adheres to standards for look-and-feel that were co-developed with MS and
IBM. So if you like Motif, you're kinda endorsing OS/2 PM and Windows.

(How do I know this? Simple, I program this stuff for a living and
stumbled across who determined this standard... and found MS and IBM
were involved, and their GUIs are based on it)

So, if you like X, you like Windows, and if you like Windows, you just lied.

Abosloutley! Lets extend this principle to some other things. Lets call digital audio '16 bit sound', so the ZX Spectrum has '16 bit sound' (2 levels), the C64 has '16 bit sound' (16 levels), the Amiga has '16 bit sound' (256 levels) and the Falcon has '16 bit sound' (65536 levels) (After all, they can all move 16 bits through their sound systems, it just takes some longer than others)

:-) (for those who have a negligible sense of humour)

Ugh!

I do not know how many times I have to clarify definitions of color
modes.

Here are excerpts from previous posts I made/responded to:

BEGIN EXCERPTS:
---------

This True Color argument is getting old. I'm not going to go in a
long speech on "What is True Color", but for those who are curious,
I recommend in looking Vol 1 of the Xlib Programming Manual by
O'Reilly. Read the beginning part on the chapter dealing with
color. Since X has to deal with every possible type of display, this
is a good source.

---------

>
>Uhm..I REALLY wish to correct you on this, and I will :) Even though Falcon
>True Color isn't "TRUE" True Color but infact High Color there is still a
>tremendous difference! 15/16bit Color doesn't dither..it really depends on
>your image..view a Raytraced Image in TIF or TGA Format and view it in TC
>and then view it in 640x480x256 and tell me there is no difference?
>

Just to make things clear, true color refers to the existence of
a decomposed index for RG&B. I remind people again to read Chapter 7
of the Xlib Programming Manual (Vol 1 of the X Window System) by
O'Reilly.

(I've seen 8bit displays support a true color visual.)

---------

>
>Can you perceive any difference between 24 and 32 bits? (By not
>knowing which is which, that is!) 256 shades of gray are
>indistinguishable already, but what about colors?
>

Usually with 32 bit color, the high (or low) order byte is used for
opacity (aka the alpha channel). This allows the overlaying of two (or
more) images by using the opacity value to determine how much of the
background image will show through the foreground image. You can get
some neat effects. AVS (Application Visualization System) uses 32 bits
for each pixel in an image (Alpha, R,G,B). Take a look at it if you
can get access to it.

Also having more bits per pixel usually allows the capable of double
buffering. SGI's have this kind of support. You can use have the high
(or low) order bits actually represent the image being displayed while
you update the low (or high) order bits with the new image. Some high
performance hardware will have 48+bits for pixels for such purposes.

---------

>
>Here's the way to think of why "true color" in the X-windows sense is
>a better definition. Under the X way, every pixel on the screen has a
>bit pattern that gives it its color - hence the bit pattern stored at
>each pixel represents its "true color", not the lookup color.

Close, but not exactly. "True color" in X implies a decomposed index
for R, G, and B (i.e. each base color has a separate index).
Therefore, you have (static/read only) colormaps, for each R, G, B.
Normally the index value for each base color has a direct
correspondence to the intensity of the color on the screen. However,
the colormaps usually contain Gamma correction to take in account of
how humans perceive color and light at different intensities.

No where did I say about the size of the colormaps. Therefore, "true
color" refers to any size implemented in the above fashion.

BTW, "direct color" allows the programmer to insert his/her own
values into the colormaps (read/write colormaps).

No, I use TWM. I have found that Motif gets in my way, and certainly doesnt seem very intuitive. It may look very nice, but IMO TWM is much more functional.

TWM is okay. But..... that doesn't mean you're not running apps that
conform to the Motif standard.

In fact, let's look around... what type of interface standard seems to be
dominant?

*looks around*

Motif.

Even Sun is moving towards it.

so if you hate Windows, I got news for you... that's what Motif is like.
so it looks like you'll be using an Amiga forever, because at some point,
GUIs will be like Windows and that's that.

Just out of curiosity, what is so bad about Windows or Motif?

Ok, they look ok, but I have always found them be clumsy and slow. Some exapmles:

Non-proportional scrollbars, so you dont know how much of a window you can see at any one time.
Menu's that dont go away when you let go of the menu button, which means you have to start clicking all over the place to get rid of them.
Having to double click on the close gadget instead of a single click to get rid of a window.
Not being able to send a window to the back (windows)
windows inside the program manager in a cheap attempt to implement screens that doesnt really work (windows)

The Atari ST implements proportional scrollbars in GEM. So much for that
problem.

Also, if you use the XmScrolledWindow as a manager for anything under Motif,
you get proportional scrollbars.

Windows 3.1 and Mac do NOT have proportional scrollbars, but... you know what?
I rank that about as important as the Amiga's inability of move a window
so that part of it is off the screen. :)

>Menu's that dont go away when you let go of the menu button, which means you have
>to start clicking all over the place to get rid of them.

That's a subjective preference. Should the user have to hold a button down
for a menu? On the ST, the popdown menus are a nice plus in my opinon at
least because they save a mouse click when you are going to a menu. They
are a waste if you go up there by accident, but this is all a matter
of individual preference.

Windows, Mac, Motif all use the press-a-button get-a-menu-until-next-click
style of menu handling.

So far, so trivial. :)

>Having to double click on the close gadget instead of a single click to get rid
>of a window.

Motif does it, Windows does it, the Atari ST requires only a single click.

You also neglect that Motif and Windows allow for a standard keystroke to
close an application window.

(so once again, I'd argue this is a matter of personal preference, and not
an issue of functionality)

>Not being able to send a window to the back (windows)

Atari ST: not possible under the TOS versions I've used extensively (i.e.,
pre-Falcon TOS, but I don't think that's changed) as a standard gadget,
but the OS supplies the ability to do just that.

Since 90% of the time, when I use Windows apps, i'm running them as "windows"
under OS/2, I know that I can do the infamous Alt-ESC to cycle through
the windows, or Ctrl-ESC to get the window list and pick which one I want
explicitly.

This is one area I'll concede that it would be a nice feature, but this is
also something that I think we could say is (arguably) not neccessary for
a GUI standard to be "professional".

(in fact, most users don't want to "bury" a window, but instead, either
iconize or place another window directly on top... and iconization is
functionally like burying the window, and this is supported by Windows
and Motif...)

>windows inside the program manager in a cheap attempt to implement screens that
>doesnt really work (windows)
>

Motif doesn't have a Program Manager. So I'll assume you're flaming Windows 3.
Those windows conceptually are tolerable. OS/2 uses the same method. I
see no problem with subwindows as long as there is a large enough (even if
it is virtual) display area.

So, Chris, what I see here is that you personally prefer the Amiga, but you
really don't have a good solid argument for sayinga the Amiga's GUI is
any better (functionally) than GEM, Windows 3, or MWM/Motif 1.2.

Also you are ignoring other concerns that I think are important. For example,
the display of fonts is more flexible for PCs and Macs than on the Atari
or Amiga. Sun is endorsing DPS, and Motif works fine with it. OS/2 and
Windows both have scalable outline font technology, and I know Atari is
*shipping* SpeedoGDOS. I have heard the Amiga has an outline font module,
but I am not aware yet of all the details... so feel free to expound on that.

Another major concern is device independence... the Amiga lacked that for
a long time, and it appears the current solution is to use "very good display
drivers" but a lot of software hit the custom chips, and apparently there
seem to be two situations for graphics applications: hit the hardware to

pull tricks and/or be device independent. From what I've seen, both can be implemented in the same app with little or no problem, but until we see RTG (is it officially part of AmigaDOS?) I think that's an area where the Amiga is slightly behind everyone else.

(in fact, it may be a problem precisely because their hardware was so good!)

Perhaps you have never heard of NeXTstep. In five years, this is what we ALL will be using. Once the bugs are worked out, it will be the best operating system in the world, not to mention the fact thet it is 100% object oriented and cross platform binary compatible.

You can do this on the Amiga (At least off of the right and bottom of the screen) just by altering the screensize and icontrol prefs)

|>
|>
|> >Menu's that dont go away when you let go of the menu button, which means you have

Again, this is a reason why I dont like GEM, IMO this method is slow and clumsy

|>
|> Windows, Mac, Motif all use the press-a-button get-a-menu-until-next-click
|> style of menu handling.

Incorrect. The Mac uses the same system as the Amiga, although you cant make
multiple menu selections on a mac beacuse they only have one mouse button

|>
|> So far, so trivial. :)
|>
|>
|> >Having to double click on the close gadget instead of a single click to get rid

Again, I was answering the question put, which had nothing to do with the ST

|>
|> You also neglect that Motif and Windows allow for a standard keystroke to
|> close an application window.

Well, I like to use this device called a *mouse* to control my GUI's....

|>
|> (so once again, I'd argue this is a matter of personal preference, and not
|> an issue of functionality)

IMO, having to resort to the keyboard on a GUI *is* a lack of functionallity.
This is why I use a 3 button mouse on my Amiga, so I dont have to use the shift
key

|>
|>

I wanst arguing about the Amiga or Gem. I was answering the post, which wanted to
know what I didnt like about MWM and Windows.

|>
|> Also you are ignoring other concerns that I think are important. For example,
|> the display of fonts is more flexible for PCs and Macs than on the Atari

|> but I am not aware yet of all the details... so feel free to expound on that.

The Amiga has included outline font support (AGFA Compugraphic) since 1988. I can
use scalable fonts for my window titlebars, my icons, and my system default font.
However, you cannot use a proportional font for your system default font. I use

Helvetica for my Windows and Icons, and Courier as my system default.

|>

Full RTG support should be available in AmigaDOS 4.0. However, most graphics boards are compatible with most software, and even have draggable screens. Again this is not a great problem, because for most applications, AGA is more than adequate.

|> although I have never heard it used much before.

Sorry, but calling 15/16 bit colour True Colour is just marketing drivel, which Atari seem to be doing more and more of these days. It's like calling the Falcon 32 bit, the jaguar 64 bit, Intel claiming rediculous MIPS ratings for their processors and windows graphics accelerators that have hardware designed to spot benchmarks and return erronious results. It's a deliberate and cynical manipulation of the 'facts'.
---

Sorry, but the True Color definition is one that is used outside of Atari. As proof, I offer myself - I had heard this definition from a graphics class I was taking, and when Atari used this definition and said the Falcon had a "16-bit True Color" mode, I knew right away that meant a 16-bit display with no lookup table. Unless you are god, you cannot say that the definition you are familiar with is the only True Definition.

|>
|> Once again, if 24 bit is True Color, then what the hell is 32-bit
|> color? How about 64-bit color? This is why the 24-bit = true color
|> definition is a silly one.

32 bit colour is usually 24 bit + alpha channel. Some workstations are now using 48 bit colour, and maybe this should be called true colour as well, who knows?
---

Aha!! So you admit the foolishness of your position.

---
But calling something true colour just because there is no CLUT is stupid, because this would then apply to a monochrome ZX81, or an Amiga displaying a 0 bitplane screen (ie black).
---

So What? It still makes more sense than your definition (And BTW - on the Amiga, any number of bit planes that you use will have to go through a table anyway, so they are not True Color - except for 0 bits

of course wich is silly, as your machine is off, and therefore cannot be said to be generating a display). As for the ZX81, yes they were True Color but of course it is a more commonly used definition to say "Monochrome" in this case.

As I've said before, True Color makes more sense when it says that the value for each pixel represents its "True Color". It makes no sense at all to talk of 24 bits of color as completeley representing every color in the Universe, when we know that it just is not so.

|> mathematical definitions have these so-called degenerate cases.
|>
|> --Gerry

Abosloutley! Lets extend this principle to some other things. Lets call digital audio '16 bit sound', so the ZX Spectrum has '16 bit sound' (2 levels), the C64 has '16 bit sound' (16 levels), the Amiga has '16 bit sound' (256 levels) and the Falcon has '16 bit sound' (65536 levels) (After all, they can all move 16 bits through their sound systems, it just takes some longer than others)
---

Thus proving Atari's definition of True Color makes more sense!! The example you give above is a close parralel to the silly "True Color = 24 bits" definition. You got part of the example wrong though, the amigas 8-bit sound can no longer be called "Digitzed Audio" (Which you have defined as 16-bit sound). We will call it "Hi-Audio" instead. :-)

As for your closing statemnet, you count the number of bits on the whole, not each bit indiviually!! I don't see how you jumped on this wild tangent after reading the original post...

:-) (for those who have a negligible sense of humour)
---
:-( (Cancellation to indicate seriousness of post)

Windows, Icons, Pull down menus, cycle gadgets, radio buttons, file requestors, screenmode requestors, font requestors etc etc.. All these things have a standard look and feel (not everyone may use it, but that situation is improving) IMO Workbench is one of the most 'solid' looking GUI's around. GEM just looks cheap and nasty, Windows *is* cheap and nasty, X windows is probably my favourite GUI (Because it's even more customisable than Workbench) and I would probably place the Mac GUI somewhere around the same level as Windows (It's slow, akward and messy)
---

Well, I'd agree with the above except that I'd swap Workbench and Multitos. I do think that this is really subjective though, and that most people like what they are used to. (except for X-windows, which really is better than anything else!! ;-) )

Perhaps you have never heard of NeXTstep. In five years, this is what
we ALL will be using. Once the bugs are worked out, it will be the best
operating system in the world, not to mention the fact thet it is 100%
object oriented and cross platform binary compatible.
---

As much as I personally like NeXTstep, I have a hard time seeing it
having much of a future. With Windows NT (which I detest on
principal, It just can't be good if it's derived from Windows!!) and
OS/2 coming along, I really think these will be the OS's of the future.

I could be wrong though - perhaps the arrivial of the PowerPC chip
will shake up the OS market, and good OS's will rise to the top.
There is just too much power behind Micrsoft to let other OS's take
over.

Just as a side note, if you think the arguments here get bad, you
should read the comp.sys.powerpc group!! Those guys are vicious...

And don't forget TOS 5.0! Full support for Iconization (called the "smaller" gadget in the Compendium) will be avaialable in 5.0. The gadget will be next to the Full gadget with the delta character appearing on the button.

You're actually right. This is something that is easy for me to forget because
I use the keyboard a lot on a Mac.

However, I still think you're nit-picking and still haven't come up with one
important aspect of GUI design (at least not yet in this post) where the
Amiga is more usable.

>

And you are incredibly naive if you believe that a mnemonic shouldn't be
used whenever possible. Have you ever heard of an expert user, Chris? Have
you ever created a pulldown menu in Motif that required the user to work
through 3-5 menupanes? Having keyboard accelerators is a big plus, and
even C= recognized that and gives key-combinations.

However, i say this from the applications programmer point of view... I
want to keep both the "wanna use a mouse" and the "must be able to do it
without a mouse because mice are slow" camps happy.

>|>
>|> (so once again, I'd argue this is a matter of personal preference, and not

>

>IMO, having to resort to the keyboard on a GUI *is* a lack of functionallity.
>This is why I use a 3 button mouse on my Amiga, so I dont have to use the shift
>key
>

I think that's how you feel but let me ask you this, do you ever have to
type a string into a dialog box? Or do you have a complete QWERTY keyboard
on your mouse too? ;)

Let's face it, during about 1 hour of interaction with a system, I would
guarantee that on any given computer at any given time, you will wind up
having to (gasp!) type if you are using an application and not a game.

Now, if you're a typist and you are using WordPefect for Windows and you
know the keyequivalent, do you want your hands to have to leave the keyboard
to move the mouse?

Nope.

Because the "expert" user wants to get things done quickly. I can see you
think that everything should be possible without using a keyboard, and that
is a valid point.. but you're missing my point that menu accelerators should
be used by the programmer to allow a non-mouse user or expert user the
ability to zip through the application without having to use a mouse.

(and this is part of the Motif Style Guide)

Now the Amiga supports this... at least, as far as I knew. I have always
seen key-equivalents for menus, so unless Commodore took this out, you're
arguing over something irrelevant except for in terms of personal preference
because C= kept up with the pack when it came to treating expert users in
a friendly way.

Well if you don't like the keyboard, don't use it. You can always go to the upper left corner of any OS/2 window and click and get the Window List. But you know what? There are 26 programmers working on OS/2 projects at my job and not a single one of them uses the "mouse method" because they want to do work, not admire pulldown menus.

From a novice's perspective, they can get the window list graphically. From the expert's perspective, they have Ctrl-Esc. I'm sorry if you don't like having options, but you were Mr. X-Windows-is-so-configurable and if you don't like OS/2, the Atari ST or the Timex Sinclair, I don't care, but just don't be hypocritical and start flaming every platform with no conception of why decisions were made regarding their GUIs.

>terms of system resources)
>

Cheap isn't what makes a GUI usable. This is totally irrelevant to our topic. Where you pulled this out of after talking about the beauty of X is ridiculous.

If you love X so much surely you must have done an ls -l once on your precious
UNIX machine to see that even with shared libs, an X11R5 app swells up in
size bigger than a comparable program on one of our dinky home computers.

So let's skip this system-resource nonsense. If that's the case, TOS 1.0 is
more functional than AmigaDOS 4.0 and we'd all have Ataris. And if you'd
switch platforms based on that argument, then you should be able to see why
what you were implyin with this system-resource stuff is nonsense.

Well, I got happy and showed that they were all "functional", at least ni
regards to your complaints.

(most of which were trivial platitudes I often see from biased advocates of
a given platform who haven't opened their minds enough to see what's good)

That's a reasonable limitation. The outline fonts would be slower to implement
on a base A500 (8mhz 68000) and probably detract frmo the machine's zippy
feel.

>adequate.
>

What's the highest resolution AGA can do? 1280x512 interlaced?

If so, you're probably right, but AGA shouldn't be the end-all be-all of the Amiga. I'd like to see the machine thrive with more 3rd party video cards and this has been happening for a while... and the support seems to be there, but it would be nicer if there was stronger commitment on the part of Commodore to RTG.

So to summarize: The Amiga is no more "usable" a GUI than Windows, Mac, or the Atari ST. There are personal preferences here and there, but functionally there was not a single concern I felt you voiced (and others may disagree) that was serious enough to say it was anything more than a preference as opposed to a bug report.

I absolutely love NeXTStep but when I think about it rationally... NeXT
has no real market penetration where it counts. And people who write
big, expensive, programs need to know they are writing for a platform that
is out there in decent quantity.

As of yet, I don't see much NeXTStep support... ouside of academia that is...
but I sincerely hope that changes.

Their biggest problem is that Sun and SGI exist and are selling huge quantities
of UNIX machines, and that Solaris 2.x for Intel is out there and more people
will give that a serious once-over than may look at NeXTStep because they
already have seen up close a Sun Sparc running it.

The Perennial Programmer (cmedley@wam.umd.edu) wrote:

[..]

: >Not being able to send a window to the back (windows)

: Atari ST: not possible under the TOS versions I've used extensively (i.e.,
: pre-Falcon TOS, but I don't think that's changed) as a standard gadget,
: but the OS supplies the ability to do just that.

: Since 90% of the time, when I use Windows apps, i'm running them as "windows"
: under OS/2, I know that I can do the infamous Alt-ESC to cycle through
: the windows, or Ctrl-ESC to get the window list and pick which one I want
: explicitly.

I think you mean alt-tab, unless you've set up your system different
to the default setting.

I prefer using AmigaDOS's Amiga-M and Amiga-N to cycle forward and
backwards through application windows. It feels much faster than
just alt-tab (go forward through list).

What about trying to get two applications to share the same screen?
Use Equation Editor with Word for Windows and try to balance the
display space so you can use both at once. It's not easy, especially
if there's other things lying around to accidently click on.
I like using background and foreground under AmigaDOS.

: This is one area I'll concede that it would be a nice feature, but this is
: also something that I think we could say is (arguably) not neccessary for
: a GUI standard to be "professional".

: (in fact, most users don't want to "bury" a window, but instead, either
: iconize or place another window directly on top... and iconization is
: functionally like burying the window, and this is supported by Windows
: and Motif...)

A lot of users are buying Norton's Desktop for Windows, which brings
the concept of screens to Microsoft Windows. Now you can group apps
together to work on the same screen instead of every Window on the
same screen. Under AmigaDOS, I like running a text-editor on the
Comms package's screen, and then flicking quickly to another neatly
laid out screen that has all the file functions and icons.

It's a hard-concept to explain why a screen is a good idea, but play
around with NDW and you'll probably agree that's better than Windows'
current system.

Iconizing applications is almost like burying a window, but it's a pain
to try to get back to it because it's often not easily accessible. I
like floating application docks the best, so I place a few of my most
important programs within easy reach.

: >windows inside the program manager in a cheap attempt to implement screens that
: >doesnt really work (windows)
: >

: Motif doesn't have a Program Manager. So I'll assume you're flaming Windows 3.
: Those windows conceptually are tolerable. OS/2 uses the same method. I
: see no problem with subwindows as long as there is a large enough (even if
: it is virtual) display area.

Use NDW and see if you agree that the concept is tolerable. It's kinda
like a faster machine, you won't need it unless you used it before ;-)

: So, Chris, what I see here is that you personally prefer the Amiga, but you
: really don't have a good solid argument for sayinga the Amiga's GUI is
: any better (functionally) than GEM, Windows 3, or MWM/Motif 1.2.

Windows desktop is distinctly a layer removed from it's underpinnings.
Delete the application, or move it to another directory and Windows
won't be able to find it.

Windows doesn't support folders at all, so there's no easy way of
seeing what's in a directory without loading up a separate directory
utility (FileManager). AmigaDOS has options so you can click on a
directory and you can see the contents, move folders within folders,
group projects together and click on the project to launch the
application.

I also like AmigaDOS's ability to see the contents of a directory
or drive in text form, and move the file names around the screen,
drop them onto another to launch the program, double click on
a filename and execute the program. Click on directory filename
and a new window will open up with that directory's contents in
text form. It's a lot quicker than loading FileManager.

Also, most programs have the important files with icons, so you
can just view the desktop and see all the files you're likely to
use, with all the irrelevant stuff hidden away from view, saving
on desktop clutter. Windows doesn't easily allow you to see
the text document or project, just the tools. Having to roll
your own objects icons all the top is a drag.

Filemanagement is very easy on AmigaDOS, so easy in fact that I
hardly ever have to use the shell to shift files around, just
point, click and drag.

From an aesthetics viewpoint, they all pretty much look similar, label
at the top, close box on the top left, minimize and maximise buttons
on the top right. AmigaDOS has background/foreground button and
sizeable scroll-bars that tell you something about the size of the

contents off-view.

I kinda miss AmigaDOS's older 4 colour 3d look. Most GUI's go for the
gaudy 16 colour or 256 colour icons now. I've started making a few
icons under Windows and OS/2 that were Amiga-like, but looking for
a program to convert them across.

Oh, if you're an OS/2 user and get used to using right-button for
menus, you can swap the left and right mouse buttons unders Windows,
but right mouse button also executes and selects, which is a bit odd.
Also, a few applications (especially from Lotus) make use of the
other button nowadays under windows, so two fingers get a work out
now ;-)

: Also you are ignoring other concerns that I think are important. For example,
: the display of fonts is more flexible for PCs and Macs than on the Atari
: or Amiga. Sun is endorsing DPS, and Motif works fine with it. OS/2 and
: Windows both have scalable outline font technology, and I know Atari is
: *shipping* SpeedoGDOS. I have heard the Amiga has an outline font module,
: but I am not aware yet of all the details... so feel free to expound on that.

Is SpeedoGDOS display postscript? I've found that DPS is kinda slow.
I'd prefer MS-DOS's standard textmodes for outright speed, though quite
a few graphics accelerators for the clone-boxes run graphics intensive
GUI's very quickly now.

: Another major concern is device independence... the Amiga lacked that for
: a long time, and it appears the current solution is to use "very good display
: drivers" but a lot of software hit the custom chips, and apparently there
: seem to be two situations for graphics applications: hit the hardware to
: pull tricks and/or be device independent. From what I've seen, both can
: be implemented in the same app with little or no problem, but until we see
: RTG (is it officially part of AmigaDOS?) I think that's an area where the
: Amiga is slightly behind everyone else.

The only programs that hit-the-hardware now are games. Nearly all
productivity applications can run on any new graphics board that
has drivers developed.

For animation and viewing pictures, it is.

|> become 80286s and 68000s when they are on a 16-bit bus? Does the Amiga's
|> 16-bit Blitter cripple it? Does anyone care?)

While I don't say the 68030 in the Falcon makes the machine 16-bit, it
surely cripples the machine the way it is implemented. By crippling I mean:
not taking full advantage of the 68030's potential.

PS: For those that haven't noticed, dithering on a TV signal can actually produce a new pseudocolor.

By all means, include hot keys as an alternative, but making a user have to
memorise dozens of key sequences because the mouse control is slow and clumsy is
surely a desing fault?

|> However, i say this from the applications programmer point of view... I
|> want to keep both the "wanna use a mouse" and the "must be able to do it
|> without a mouse because mice are slow" camps happy.
|>

And this is my point. There is no reason why a mouse should be slow. Look at pull down/pop up menu's as implemented by AmigaDOS, TWM and MacOS. In use these are certainly a lot faster than the click click click methods used by a lot of other GUI's (Windows, Motif, GEM to some extent) Another nice feature that you may not have seen in AmigaDOS is the the facility to jump straight to the top left of the screen, if you are using a virtual screen, whenever the menu button is pressed (Again, this is a standard preferences setting). A better soloution however, would be implementing pop up menus, which the Amiga has available as public domain software, and which I really must get round to installing one day :-)

```

|>
|> I think that's how you feel but let me ask you this, do you ever have to
|> type a string into a dialog box? Or do you have a complete QWERTY keyboard
|> on your mouse too? ;)
```

No, if the string is a filename, font name, screenmode name etc, I like to use the standard requestors. However, I don't believe in the MAC philosophy of 'thou shalt always use the GUI', and I often use command shells etc. in preference to the Workbench. Using GUI's in preference to textual interfaces was not the point I was arguing, and indeed, I would not argue this point, because I like to use both.

```
|>
|> Let's face it, during about 1 hour of interaction with a system, I would
|> guarantee that on any given computer at any given time, you will wind up
|> having to (gasp!) type if you are using an application and not a game.
```

Wrong. If I'm using a piece of software such as DPaint 4.5 AGA or Imagine II, it is highly unlikely I will need to touch the keyboard on a regular basis. On DPaint, there are a couple of things that can't be done with the mouse (Turning the toolbox on and off is an example, but pressing F10 occasionally hardly counts as typing). With Imagine, however, the only time I would ever touch the keyboard is to type in a filename for a new project.

```
|>

|> be used by the programmer to allow a non-mouse user or expert user the
|> ability to zip through the application without having to use a mouse.
|>
|> (and this is part of the Motif Style Guide)

And again, this was not my point. Hot key shortcuts in wordprocessors are an obvious plus, but making the mouse controls for any arbitrary application so akward that you are compelled to leave the mouse and go to the keyboard is surely a bad thing?

|>
|> Now the Amiga supports this... at least, as far as I knew. I have always

|>

The Hot Key system on the Amiga is incredibly powerful under 3.0. You can set up key events to do pretty much what you want, and customise the ones that are already there. In fact, you arent even limited to keyboard shotcuts. You could do something really silly and have left amiga right shift alt middlebutton diskinserted iconify a window for example :-)
The point I am making is that I can go to a pull down menu, make 5 or 6 menu selections in rapid sucession, much faster than I could by leaving the mouse, typing in all the relevant key combinations, and returning to the mouse again.

Wouldnt know about OS/2, because I havent used it. I have heard good things about it though (I believe that much o it is based around AmigaDOS). When switching between applications though, the Amiga has a much quicker way of doing it than any other method because it has screens, and can cycle through them 2000 times a second (although wether or not you can click the mouse or LAmiga M that fast is another matter :-) )

|>
|> From a novice's perspective, they can get the window list graphically. From

|> decisions were made regarding their GUIs.

As I said, I wasnt refering to any of the above platforms. merely pointing out how Windows/Motif have clumsy mouse control, that discourages users from using the mouse when they might not want to use the keyboard all the time. There is nothing wrong with having options open (this is one reason why I like AmigaDOS so much, it's configurabillity). I dont like using Mac's for precisely the same reason, they make you do everything the way they want you to do it. (Even worse than Windows because at least the alternate control method exists on windows, even if it hasnt been implemented very well.)

|>

I never said Unix was cheap in terms of resources, and that is unfortunate.
However, being able to do things inexpensivley cannot be a bad thing, surely?

|>
|> So let's skip this system-resource nonsense. If that's the case, TOS 1.0 is

|> switch platforms based on that argument, then you should be able to see why
|> what you were implyin with this system-resource stuff is nonsense.

You miss my point. Providing the same (or a better) level of functionallity using
less system resources is something which should be encouraged. However, claiming
something is better because it uses less system resources by being less
functional is silly.

|>
|>

There *are* features I like about Motif and Windows, and would like to see them implemented in AmigaDOS. The ability to easily re-size a window from eight different points for example.

|>
|> >|>
|> >|> Also you are ignoring other concerns that I think are important. For example,

|> feel.
|>

You can aliviate this problem on a 500 to some extent by generating the bitmaps for frequently used point sizes and caching them on disk. I dont find this necessary on my 1200 though, because of my 25MHz '882 :-)

|>
|>

|>
|> What's the highest resolution AGA can do? 1280x512 interlaced?
|>
|> If so, you're probably right, but AGA shouldn't be the end-all be-all of
|> the Amiga. I'd like to see the machine thrive with more 3rd party video
|> cards and this has been happening for a while... and the support seems to
|> be there, but it would be nicer if there was stronger commitment on the
|> part of Commodore to RTG.

AGA's (or rather 3.0's) highest resoloution is 720*1100 interlaced. AGA is only an interim soloution. AGA+ offers 1280*1024 (interlaced) and AAA (June 94) offers 1280*1024 24 bit non-interlaced, and much higher resoloitions, although in fewer colourts I believe.

|>
|> So to summarize: The Amiga is no more "usable" a GUI than Windows, Mac, or

|> there was not a single concern I felt you voiced (and others may disagree)
|> that was serious enough to say it was anything more than a preference as
|> opposed to a bug report.

That's your opinion based on your personal experiecne and preferences, which is fine. I, however, prefer AmigaDOS and TWM to Windows and Motif. they may not look as pretty, but IMO (and in the opinions of most other people I have asked) they are much more functional.

There are cases where you simply can not make everything available with a
few button presses. Here's an example... a hierarchical menu system. To
get to a button 3-4 levels down, you have to navigate the cascading menus.

If you can get the same place with one keystroke, which is better?

For the novice, it makes sure they know what they want via the menu hierarchy
and removes ambiguity and groups objects visually by their function. A
good thing.

For the expert, the key equivalent offers a powerful alternative. A good
thing.

Popup menus are a better way of dealing with that, but I find the Amiga
solution acceptable though not perhaps perfect.

(Believe it or not, studies have shown that users don't usually respond well
when the mouse cursor is moved for them by the application... it reduces
their level of comfort with the system. Honestly, I feel that way too with
the funky sliders used in some OpenLook apps...)

>is highly unlikely I will need to touch the keyboard on a regular basis. On

>

That's a matter of preference. I know I personally like to have the keyboard
on my left side for some quick command key sequences so I never have to let
up off the mouse while being able to zip through applications like an expert.
:)

I don't think there is any application I can think of where I, after heavy
use, didn't find myself using the key equivalents on ANY platform. The
reason is simple... it gets me where I want to go quicker.

>The point I am making is that I can go to a pull down menu, make 5 or 6 menu
>selections in rapid sucession, much faster than I could by leaving the mouse,
>typing in all the relevant key combinations, and returning to the mouse again.
>

Well this is more of something to do with your way of holding the mouse. :)

Do you use both hands to cradle your mouse lovingly? hehehehehehe

Kidding aside, my way of doing things is different. Your method is equally
valid and I don't want to sound dictatorial like my way is the only right
way.

What I typically do is use my left hand for any key combos and hold the mouse
in my right hand. That allows me maximum speed when using an application I'm
familiar with. Now if someone says hit "Ctrl-P" that may be a bit uncomfortable
on a Mega ST keyboard... so yeah, then I might use the drop downs, but for

the most part, ergonomics and speed favor the keyboard shortcuts.

Well, I don't think OS/2 was based on AmigaDOS. Wishful thinking from an
Amiga advocate, methinks.

(OS/2 even crashes elegantly... :) )

It does offer threading (a big plus) and a GUI that is identical to Windows
as far as window-appearance and decoration and adds to that standard key
equivalents for some features as well as a more usable "Desktop".

>
>I never said Unix was cheap in terms of resources, and that is unfortunate.
>However, being able to do things inexpensivley cannot be a bad thing, surely?
>

It depends on what you lose, and what your users want. For example, if the
ST didn't have any DTP programs, SpeedoGDOS would be an expensive waste, but
there are users who want WYSIWYG. For me, as a musician, I don't care much
if fonts are outlined or what. When I'm at work on my 486 and we're doing
report modules for our software, I care a *lot* about fonts and appearances
because my users want that. So it's a question of expense vs. what it
delivers. In some cases I'd rather lose speed to have features and sometimes
it's the reverse.

>|> What's the highest resolution AGA can do? 1280x512 interlaced?

What machines are planned to feature AGA+ and AAA? I have heard of AAA but
then I've heard a lot of vapor from the Commodore camp dating back to the
infamous DSP board they were allegedly going to make.

(Greg Block is still waiting for that one so he can flame the Falcon some more
I know...hehehehehehe... hi Greg! :) )

>are much more functional.

Well, perhaps the people you ask share your tastes. I think the people I know
represent a pretty diverse group... and some do use AmigaDOS (they own
Amigas, believe it or not :) ). I'm not saying one GUI is *the* solution,
but that there is no way for you to claim one is "junk" or unusable. And in
fact, I would hazard a guess that if Windows or the Mac interface were so
crummy, the altar of the competitive marketplace would have weeded them out.

Remember, Windoze went through 3 revisions just to become TOLERABLE. Motif
is up to 1.2. We're using X *******11********* Release *********5********.
That's a lot of work and the market has surely shaped all of those efforts,
just the way MultiTOS and AmigaDOS have been and will be shaped by the
demands of users.

You're right. :) But the Ctrl-ESC was right. :) Too much VT terminal
emulation in my youth...

>I prefer using AmigaDOS's Amiga-M and Amiga-N to cycle forward and

Well screens, conceptually, should be faster at times. One reason I can
think of is that the applications are in seperate displays so bringing
one forward may not force exposures on others.

>What about trying to get two applications to share the same screen?
>Use Equation Editor with Word for Windows and try to balance the

Well, the solution on the PC is to buy a bigger monitor. :)

I've had a ton of windows open under Windows and OS/2 and, this is as
a programmer on those platforms, moreso than as an app user, I've had
no problems at all doing these tasks, which admittedly are a bit less
intense than using what you describe.

(and i was stuck on a mere 640x480 display for a while!)

I haven't used NDW a lot... what little I did get from it was that it
was a "true" desktop like the Mac's, Atari's and Amiga's.

>Iconizing applications is almost like burying a window, but it's a pain
>to try to get back to it because it's often not easily accessible. I

The only problem with docks is that they seem to force a particular method
for grouping your applications on you. And on the NeXT, until Alt-Dock came
out... life was miserable if you used lots of neat stuff. :)

>

Well this is all at the application level... for example, I consider the
aspects of Window as a GUI separate from how they chose to implement
their "desktop" (i.e., Program Manager & File Manager). And as you've
already stated, they have 3rd party programs that fix this (NDW).

>I also like AmigaDOS's ability to see the contents of a directory
>or drive in text form, and move the file names around the screen,

I agree. Heck, I'm a spoiled Atari user and I love that aspect of my
GEM box here.

>Also, most programs have the important files with icons, so you
>can just view the desktop and see all the files you're likely to

>your own objects icons all the top is a drag.
>

Agreed. But once again, this is a problem with the desktop they implemented,
NOT the standards the GUI adheres to. It's always possible to write a bad
application that conforms to a GUI standard if you don't think out how
the user is going to react.

>Filemanagement is very easy on AmigaDOS, so easy in fact that I
>hardly ever have to use the shell to shift files around, just
>point, click and drag.

I remember the old days of the Amiga when no one used the GUI and just relied on the CLI, believe it or not. :)

(at least the people on BBSes around here... used to always have flame wars over the quality of the GUIs and Amigoids would always go "Only lamers use Workbench anyways... i used the CLI..." and now the system has matured into a nice GUI...)

I like textmodes too, but the Atari ST is purely graphical in dealing with text. :(

SpeedoGDOS isn't postscript I believe... it's just yet another outline font standard.

>not taking full advantage of the 68030's potential.
>

This is ludicrous. I supposed I'm crippled because I have the genetic
potential to bench press 400 lbs. but my current max is 270 lbs. right?

geez.

Well, did it occur to you that just maybe the machine is still good
despite not reaching its full potential? For example, if you read about
Cubase Audio, it requires a 68040 Mac with a digital audio card. Big
money. The "crippled" Falcon keeps up with Sinclair-baby's '040 Macs when
it comes to digital audio with NO ADDITIONAL HARDWARE.

Now sure, this is a specific use where the Falcon's DSP helps it a lot....
but what are Atari users? Where is Atari's market? The DSP is intriguing
to the programmer/hacker/hobbyist and useful for the musician. I'd prefer
the 16-bit CPU bus to lacking a DSP if it means I can do affordable
hard disk recording and have a nice platform for running GNU C++ and cocking
around with a DSP (which probably would beef up my resume' because if you
look out there in the classifieds, they need DSP programmers... and any
and all experience helps... believe me!)

>
> Would like to see animation playback though :-)
>

Can't go any faster than 60hz. :)

(our PAL using European brethren must go along at 50hz.... :) )

If you know where the menus are on an amiga, this is very fast indeed because it's menus work very quickly.

|>

It doesn't move the pointer. Just moves the virtual screen to the top left
corner, so the menus are visible.

This is a little harder on an A1200, where you may not want to move the keyboard,
because the harddisk is inside it :-)

And I would say that that is probably down to a flaw in the design of the GUI which implements clumsy mouse control (Windows and Motif again). Have you tried using Amiga apps such as DPaint, Cinemorph and Imagine extensivley?

|>
|> >The point I am making is that I can go to a pull down menu, make 5 or 6 menu

|>
|> Well this is more of something to do with your way of holding the mouse. :)

I would say this is due to the way menus are implemented. Under AmigaDOS, menus appear very quickly, you dont have to click click click like you do in windows. You dont have to let go of the menu button and start again everytime you want to make a multiple menu selection, you just navigate the menus using the right button and mouse, and select options using the left button as you pass.

Nope, apparently the IBM designers looked at AmigaDOS, and decided they liked it,
so based much of OS/2 2.0 on AmigaDOS

AGA+ I dont know. AAA is planned for next years high end models, and is already
in silicon and running. It is definitley not vapour.

I have friends who agree with me on this who own PC's, Amigas and Archimedes'
Most people I know who have bought Wiondows for their PC, or have a PC which came
with windows dont use it anymore, and prefer to use MS-DOS.

Well, AmigaDOS 3.0 is actually version 39 :-) :-)

>produce a new pseudocolor.
>
Well, I _HAVE_ checked it out on my RGB (Multisynch) monitor, and it is not dithering! it is, however, flickering, even in non-interlace. What it looks like it is doing is page-flipping between 2 different images and using that to sort of "tween" a new color half-way from one screen to the other. But, this would only double the number of colors available, so it is probably wrong. BUT: it does look better than the standard 16 bit True Color display, it might (I can't tell) look better than the VIDEL display, it is not dithered, but the refresh looks lower than 60 hz, i.e. a little flicker (not interlace flicker...)

Not to mention that while navigating those 3 or 4 levels of submenus, using the Mac or AMiga(?) way of having to hold the button down for the entire selection dramatically increases the chance of accidentally "slipping" off the button and selecting the wrong thing. The ST or Windows way where the menu is down until a click does not have this problem caused by finger fatigue. A silly point, you may say, but then I ask you why are there countless hacks for the Mac to make the menus ST or Windows like? I even wrote one...\

Oh yes, absoloutley. Lets waste megabytes of memory running Emacs in 24 bit colour because your Paint package needs it, and let's have to spend huge amounts of money on massive monitors and hi res 24 bit graphics cards to stop your desktop getting cluttered as hell. How *very* sensible

If you know where the menus are on an Atari ST you can get there quickly.
But do you really think moving the mouse is quicker than one keystroke?
If so.. well... why even use keyboard equivalents? Why even put them in
the system? I mean, the logic, as born out in numerous papers done on the
topic, is that expert users don't want to stop what they are doing to
move the mouse to the menu if at all possible.

>|>
>|> If you can get the same place with one keystroke, which is better?
>
>Depends if you need to let go of the mouse to activate the hot key.

It's not really just the button presses but the time it takes for the user
to get from where they are to the menu, and then to move the mouse through
the menus, even if they are popups.

>|>
>|> Popup menus are a better way of dealing with that, but I find the Amiga

Which parts? :)

Look at OS/2. I see nothing visible about it that implies AmigaDOS. And
as far as functionality... well..... all multitasking systems are evolved
from UNIX, even if they are just from the specs.

>

No, I think moving the mouse pointer a few centimetres is quicker than letting go of the mouse, pressing two or more keys on the keyboard, which may require both hands to do, and then grabbing hold of the mouse again. is this so hard to understand?

|>
|>
|>
|> >|>
|> >|> If you can get the same place with one keystroke, which is better?

Usually takes me about half a second from the menu appearing to the menu diasappearing. Takes a lot longer to let go, move to the keyboard, and move back again.

|>
|> >|>
|> >|> Popup menus are a better way of dealing with that, but I find the Amiga

|> for someone's Master's thesis. ;)

No it is bnot the same as moving the pointer. The pointer stays exactly where it
is. You just move the mouse up to where the menu bar WOULD have been if you were
not using a virtual screen.

|>
|>
|>
|>
|> >|> :)

Nah, I dont have enough desk space to start moving it around anyway. :-)

|> geez.

That's GEEZ to you. What good is it to have 'a better CPU' when its
performance has to go down thanks to the 16-bit bottleneck? It's like
a "68030SX."

|> Well, did it occur to you that just maybe the machine is still good
|> despite not reaching its full potential?

Oh, yes, it occurred to me. But since there are people that pretend
that it has no impact at all, or start saying nonsense about the A1200,
this point has to be brought. If it doesn't apply to you, ignore my
posting.

|> For example, if you read about

You got your valid points. Congrats. Now tell that to some of your
fellow Atarians using the same logic, but with the A1200.
I have nothing against the Falcon, except false claims from *some* people.

I'm currently running OS/2 with a 1024x768 16bit screen. Starting Emacs and then checking on its memory use reveals that the shell it is running in owns 220k and is using 132k and that the program itself owns 312k and is using 168k. Funny, that doesn't appear to be wasting megabytes to me. Gee, do you think that perhaps text-mode only apps are actually being emulated as such and not using some ridiculous bitmap-text scheme?

#DEFINE sarcasm
Well, A Cray III is obviously much better for writing letters on than any silly little microcomputer, so I think I'll go and buy a CrayIII, because I think the practice of using small inexpensive microprocessors by people such as C=, Atari, Acorn, IBM etc etc. and writing applications in C, assembly lang etc. is really dumb. No, I'm willing to spend the money on a CrayIII, runniing Word for Windows, on an 80386 emulator written in interpreted LISP, with the LISP interpreter running in Commodore 64 BASIC, which is running on a 6502 emulator written in SML. Yes, much better.

Who said anything about letting go of the mouse?

Do you read my posts?

Do you use both hands on your mouse?

I use my left hand primarily for handling menu accelerator keys (within reason,
and I gave an example of one I *can't* do without letting go of the mouse,
a Control-P on a Mega ST keyboard). However, most keystrokes are easily
done with one hand. If you can't do it, well... eat more... your hands
can increase in size. :)

Like I said, did I ever say I let go of my mouse? Of course it's not
like it's a security blanket. You know we are all functioning human beings
without our computer mice. :)

The pointer stays the same but the screen around it changes, right?

If the entire screen is changing, well... isn't that functionally the same
as if you were using say, a virtual window manager like tvtwm, and you could
"warp" (i.e. move) the mouse to another screen area instantly and keep the
mouse pointer in the same area relative to the display?

If this is not the case, you really need to be more descriptive. :)

|> Do you use both hands on your mouse?

No, but if you type properly, half the keyboard would be totally inaccsessible.
If you don't, you'd probably have to go and look where the key is anyway.
I find that for the majority of cases, I can control my Amiga much more quickly
using the mouse, than using a combination of mouse and keyboard, or just keyboard
(try deleting 6 arbitrary files out of a directory of 50, where a simple pattern
match wont work from a shell, and see if you can do it as fast as I can from
Workbench. I seriously doubt it.)
This brings me back to my original point, a GUI such as Windows (which is
*supposed* to be user friendly) has a badly implemented windowing and menuing
system which practically forces you to go and learn N hot key combinations if you
want to get things done quickly. You don't seem to think this is a design flaw...
strange.

I could say the same about you and your keyboard... :-)

And if you are only using one hand, you end up running out of meaningful hot keys very quickly, and have to resort to silly ones like CTRL LALT LAMIGA LSHIFT W or something equally esoteric.

|>
|> >

right

No, because you are concentrating on where the pointer is. That's why moving the pointer for you would be a bad thing, because you'd have to go and find it again.

|>
|> If this is not the case, you really need to be more descriptive. :)

I did have a trackball. It only had two buttons, I found it uncomfortable to use for long periods, not particually suited for using with DPaint, and it broke :-(

Now I use a hi res optical mouse with three buttons. Much nicer, and no ball to clog up either.

|>

According to the MD of C= UK, they have decided on HP's RISC technology. Considering the fact that they were also contemplaing the Alpha a while ago, this would seem to mean PA-RISC. I haven't seen one of these in operation, but I have seen a demo of the Alpha. All it was doing was playing back a few 320*200 anims (mostly taken from a CDTV :-) ) at once under X-Windows. Cant say I was too impressed. Aparently the PA-RISC architecture is much more powerful in a lot of respects.

>>|> If it is in silicon and running... why wait until next year?

Maybe it is just a prototype they have in silicon and running yet?
And they have to design computers around the AAA-chipset.
Designing a new generation of AMIGAs is not done in a week.. :-)

>>Because you need to write display drivers into the OS, and AFAIK, C= want it in
>>their RISC Amiga running AmigaDOS 4.0

That would be a major step.. RISC, AAA and 4.0 (RTG) at the same time.
The Amiga did a quantum leap when the AGA came, but if all three things mentioned above happens at the same time - it is nothing less than a massive earthquake..

>And what RISC chip have they chosen?

I guess we'll find out when the first A5000 leaves the factory. :-)

Anyway - my guess is that the first AAA-machine is going to have a '060-CPU, because rewriting the OS for a RISC CPU may take a while.

^^^^^^^^^^^^

Excuse me for not living in a totalitarian police state where we all take
typing lessons to learn the "one right way" to do things.

God forbid someone uses a Dvorak layout. :)

>If you don't, you'd probably have to go and look where the key is anyway.

I do 66 wpm without using proper typing technique. :)

(Heck, I've written over 100,000 lines of assembler code... think I could
do that if I was a "hunt 'n peck" typist?)

>I find that for the majority of cases, I can control my Amiga much more quickly

Depends. Soemtimes if you have 150 files in a directory, you may spend a lot
of time scrolling around looking for the files. If you know the file
names you could do:

rm file1 file2 file3 file4 file5 file6

on an Atari with MiNT. Change the rm to del for PC users. :)

No, you said that Windows wasn't a functional GUI and when pressed to describe
your complaints, the best you can come up with are things like "It looks
ugly" and "I don't like the window gadgets" and complaints about File
Manager and Program Manager. Never mind that your complaints are about the
desktop, right? Just flame the entire GUI. That's like me saying the Amiga
sucks as a computer because it can't do one thing (MIDI for example). It
would be an equally ludicrous and incorrect claim.

Depends on your reach and on how nice the person was who wrote the program
was.

If they know anything about user interfaces, they probably know enough to
make their keycodes something either intuitive even if it isn't easy to
do with one hand, or they consider how easy it is to type.

That's a good point. But it would probably still annoy a novice.

I never mentioned the file manager, I never said I didnt like the way it's gadgets looked. I said I didn't think it was as functional as TWM or AmigaDOS because in comparison to them, it was slow and clumsy as a user interface. this whole thread stared when I said I liked X, but not windows, and I was called a liar because apparently I said I liked Motif, which I did not. Now i find this happening again, with you comming up with complaints I never made.

Well most Amiga porgrams use standard hotkeys, wich is nice. You can also define
your own, and re-define system ones.

|>
|> If they know anything about user interfaces, they probably know enough to

Exactly! And if they require more than one hand to type, then you have to move
your hand from the mouse if you were already using it.

Well, if you were a novice user, and you didnt like it, then you dont turn the
option on in IControl prefs. It's all confugurable.

Hold COntrol with your left pinky and streatch out your thumb. I can
comfortably hit 0, P, ;, and . if I need to. :) Anything more to the
right than that is a stretch. The only time I take my right hand off my
trackball is when I'm typing (such as now) I think command key shortcuts
are essential to any program!

Erm... since when does one use home row for typing command keys??? Oh well...
as for your example, here's how I'd do it from my ST. Left hand on the
shift key, right hand on mouse. select the 6 files. move right hand off mouse
(oh no!) 5 inches. Hit Control-Delete (hot key I assigned for the "delete
Item" menu) SInce delete is right next to return, I immediately hit return,
and the files are gone. Now, without using the keyboard, this would be:

Select file one. drag all the way to the trash (I'm running 800 x 600) move
the mouse to the OK button. hit it. Select file #2 .......
Even with a mouse button for "Shift" I would still have to drag all the files
to the trash then move the mouse back to where the OK button is.... In this
case Keyboard + mouse is quicker. Sorry, you lose. :)

: I'm currently running OS/2 with a 1024x768 16bit screen. Starting
: Emacs and then checking on its memory use reveals that the shell it
: is running in owns 220k and is using 132k and that the program itself
: owns 312k and is using 168k. Funny, that doesn't appear to be wasting
: megabytes to me. Gee, do you think that perhaps text-mode only apps
: are actually being emulated as such and not using some ridiculous
: bitmap-text scheme?

I think OS/2 makes everything in some bitmap-way. You may be using non-proportional fonts, but OS/2 doesn't use text-mode unless in full-screen mode (say emulating a DOS box). Unless OS/2 has got some funky way of interleaving hi-res bit maps with lower vesa text modes.

Having everything on the one screen may not be so great when using a non-accelerated card. I switched back to 800x600x16 because it was too slow in 800x600x256 when scrolling down in some of the Windows text editors. You can notice the difference in speed. Problem is my 256 colour backdrop of Elle MacPherson looks rather sickly now ;-(. I have to use a few anime girls from KOR now.

I'm not too sure how it works, but there doesn't seem to be much chance of running out of video ram in a clone box. Where do they store the hidden parts of windows and applications? Judging from the big black empty space windows must redraw when applications have been moved, I guess each program must tell Windows what to redraw?

: If you can get the same place with one keystroke, which is better?

: For the novice, it makes sure they know what they want via the menu hierarchy
: and removes ambiguity and groups objects visually by their function. A
: good thing.

: For the expert, the key equivalent offers a powerful alternative. A good
: thing.

The problem with key equivalents is that everyone seems to have their
own way of doing it. MS-DOS apps are probably the worst, with esc or
alt bringing down a menu, and every editor and comms package uses
different keys to do the same thing.

Most GUI apps are getting better, but I have noticed that a lot of
Windows apps seem to mix freely between pull down menus and radio
buttons. For small lists, radio buttons or check boxes are better.
EG. Use Windows Setup, pull down the options menu by clicking once,
then select the option you want, clicking again. It would have been
much easier to have four buttons on the menu bar, requiring only one
click to get to that sub-window/program.

The worst thing about windows is when one app really wants your
attention because something has gone wrong. It locks you out of
all other apps and doesn't let you try to fix it (in the background).
You have to see to it and then either fix it or do something else.
There are times when the app isn't worth bothering with, but it forces
you to stop what you're doing and fix it ;-/

While all you fools are arguing about 24bit/15-16bit/Ham8 color, has anyone
ever seen a picture that uses 24bit fully?
Any picture is limited in it's colors by the number of pixels on screen. So
for me, if a picture uses it's full abilities, by one color per pixel, the most
I have ever seen is 1280*1024 = 1310720 pixels, so please explain it to me ....
or is this a valid point ... ?

Karl.

I disagree. From what I have heard, NT is not doing well at all. In fact, most PC users I know say that it is nothing but Windows + Novell. I hear that it is incompatible and clumbsy. I also have heard that whenever Bill Gates doesn't seem to be happy with it's sales. I realize that rumor is not entirely reliable, but I think that if it were doing well, then that is what I would be hearing predominantly. OS/2 I think is a decent system, but the pure brilliance behind some of NeXTstep's features is bound to catch on, regardless of weather it is the actual OS of the future.

>If you can't see the point - try glasses.

WHAT installed base - 20 to 30 thousand Falcons?? The vast
majority of Ataris will continue to be 68K based with the STe/ST

>030+

What does the plus mean? You CANT get a Falcon with a 68040. You
cant even get one with proper 32 bit memory access or one that goes
faster than 16 MHz.

FACT: About 300 000 A1200s have been sold TO DATE. Thats what I call
a userbase!

FACT: You can get Amigas in 020, 030 and 040 versions OUT OF THE BOX

FACT: The Amiga 030 machine runs at 25 MHz - not the 16 Mhz of the
Falcon

>|> the A1200 I/O to F030 standards without spending exactly the same,

> Not the SCSI-II, granted. The MIDI, LAN and SCSI I, yes. And
>you have a 50Mhz/50Mhz FPU machine too. This is also useful you know.

Actually, AFAIK the F030 only has the SCSI-II command set. It doesnt
offer the speedup offered by the SCSI-II fast and wide standards,
it`s not that much better than SCSI-I - especially as most F030
users will buy SCSI-I drives since they are cheaper and more
plentiful.

BTW; CSA have released a card that fits in the trapdoor slot of
A1200s that gives a 50 MHz 030, a socket for an MMU, expansion
potential to 128Mb RAM (via SIMMS) and a SCSI interface (presumably
SCSI-I)

Other cards are availble that give similar specs and there is
supposedly an ICD card similar to the above that gives true SCSI-II

IF you really want all this stuff, then its available to buy. On the
other hand, most people will be happy with the base A1200 and may
expand the system slowly and as they can afford it.

How much is there in the way of faster CPUs for the F030. A 16Mhz
030 with only 16bit ram access isnt really going to give users the
sort of raw CPU speed they need for power hungry applications like
DTP or ray tracing is it??

(and dont spoof about the DSP - there is virtually NO software that
uses it to do anything useful)

In your opinion.

What happens if you have one window that is 8-bit and another window that is in 16-bit and maybe another in 24-bit?

Can all three windows co-exist on your desktop space?

Having screens on the Amiga are a definite plus. You can have different resolutions on each screen and for me, each screen is only a few clicks with the mouse away. Screen cycling via mouse is so easy, don't need Amiga-N.

Dream on Rickard. Who the hell would want such a machine if its
not an official Atari release? Just what software will even RUN on
the machine? Does it actually exist? - You seem to make things up
when challenged about the shortcomings of the Falcon.

Seems to me that even IF this mythical machine exists (a big IF),
people who want an 040 machine will buy an A4000/040 or a Mac Quadra.

BTW _ is this machine actually FALCON compatible - or is it just an
ST with an 040 processor - there is a BIG difference.

Gavan.

Its an ST clone with an 040 processor. Its NOT an 040 Falcon and
^^^^^^^^^^^^^^^^^^^^^
frankly, I think you could just take an 040 Amiga (the A4000/040)
and run an ST emulator on it to get the same effect.

Do you know _anything_ about computer animation? Heres how it
works:

You render a frame of animation. (you`ll need a beefy 040 at
least for maximum speed - a weedy 16/32 030 at 16Mhz is unlikely to
cut it)
You save it to a mass storage medium
You do the next frame.

When you have done all the frames you record them a frame at
a time using a film system or a single frame video recorder/laser
disk.

Of late, with the advent of high powered desktop machines you
can actually animate in real time on your computer screen - again
this is by effectivly replaying digital video. Usually, it is
cheaper to go for the single frame approach if you are doing it
professionally. For personal users, replay off hard disk (or CD
using MPEG) is a much better option.

In all these cases HAM8 is a better bet as it offers more colours
and higher resolution than the `16-bit` (actually, its only really
as usable as 15-bit since the extra green level isnt much use on its
own). There is NO DOUBT that a HAM8 picture is closer to a 24-bit
picture than a Falcon 15/16 bit screen - and all with half the
memory - very useful for real time animations.

No - its an 040 MEDUSA. I think Atari lawyers might have
something to say if they called the machine an Atari.

It still isnt widely available nor is it Falcon compatible.

If I remember correctly, the Amiga 4000 does not support the 68040's burst mode so it isn't as fast as it could be.

By your definition, the Amiga 4000 is crippled since it doesn't take full advantage of the 68040's potential.

Personally, I don't think the Amiga 4000 is crippled. I think it's a nice machine. I've always disliked the phrase "crippled" since it implies that the machine is useless and I consider it somewhat of a thinly veiled putdown.

Just out of curosity, have you actually used a Falcon030 for any extended period of time? It's really a nice little machine. In my opinion, most people wouldn't even guess that it had a 16-bit CPU to memory interface based on its performance alone. A lot of the demos that I've seen are extremely impressive.

What I meant was that it (OS/2) isn't drawing the image in main memory and then blasting the image onto the screen. The program itself does not allocate memory for a screen bitmap, it only needs to worry about the 2k or so needed for the text display. A word processor with font support is a bit different, but the amount of memory used is not on the order of megabytes of memory as Mr. Brown implies.

>Having everything on the one screen may not be so great when using

What sort of video board do you have? I use an ET4000 ISA board at work which is non-acclerated (and a relative dog compared to my ATI board in my personal machine) but it is usually faster in the 256 color modes than in the 16 color modes. Based on my own programming experiences with the same board, I've come to the conclusion that this is generally true because the pixels are chunky instead of planar and as a result require fewer reads and writes.

>I'm not too sure how it works, but there doesn't seem to be much

>redraw?

Windows and OS/2 use the equivalent of the dumb-refresh windows found on the Amiga. The window borders, text, and other parts are drawn algorithmically, although some icons are bitmaps. Bitmaps within the window are bit-blasted, but some of the graphics are of the structured drawing type and are redrawn each time. (Am I the only person who absolutely hates structured drawing type graphics? Ugh, I can't stand the flat look of these things, it's too much like clip-art.) Some of the windows acclerators use cached bitmaps for icons, window gadgets, and other small bitmaps. They are cached in the free memory that is usually left over on the video board, resulting in significantly faster redraws for certain objects. A good driver will also perform a bit-blit when moving a window around instead of a redraw, so long as the window is not moved off-screen.

>or is this a valid point ... ?

>Karl.

The advantage of 24 bit is its improved dynamic range, even if
you cant get all the colours onscreen at once. Pictures look
punchier and more photorealistic than those with less colours.

Simply put, the more colours you can have to choose from and on
screen, the better your picture will look. HAM8 has a true 24-bit
pallette and 18 bit onscreen, so will look better than the 15/16 bit
F030 mode. 24 bit is obviously better still, but for most display
purposes HAM8 is closer. Its very hard to tell the difference
between ham8 and 24-bit, but 24-bit is obviously better (though it
takes 3x the memory)

Quite right, it emulates an ST, an 8 MHz 68000 machine with
320*200*16
640*200*4
640*200/bw
graphics resolution (the latter one INTERLACED).

Are there no REAL emulators (i.e. emulating a graphics board (after all,
the ST HAS retargetable graphics), or STE/TT sound capabilities?)

Sorry,but do you mean the Amtari-emulator?
It doesn't work at all with an A4000!! :-(
Amtari fails in the A4000/30 because of the missing MMU and it fails in
the A4000/40 because of TOS' troubles with the 68040-Processor. (Tests in
Amiga(M&T), AmigaPlus and AmigaSpecial over here in Germany)

Here 's my Question to Medusa-users:
Does TOS 2.06 solve this Problem or do you need a Patch for that?
Mail me, please!

^^^^^^^^^^^^^^^^^^^^^^^^
Some kind of understatement here, right? And what about file requestors?
(OK, BOOPSI, but the ST line always had a standard File Selector Box,
that could of course be replaced with your favourite one (e.g. Selectric
or MFSFM (for extended File Systems, such as the MINIXFS). PLUS, all clean
applications run from TOS v.99 to MultiTOS.
And, we also have windows, icons, pull down menus, radio buttons, a kind
of screenmode requestor (well, switching screen mode is slower than on the
Amiga, and less elegant). And for cycling through windows we use a key
instead of a gadget.

>Workbench is one of the most 'solid' looking GUI's around. GEM just looks cheap
>and nasty, Windows *is* cheap and nasty, X windows is probably my favourite GUI
^^^^^^^^^
Depending on the GEM version and additional software one uses. VDIfont
e.g. replaces the original (ugly, IMHO) font with a different one,
different icons are a great improvement (TOS 2.x,3.x,4.x) and Gemini
(THE replacement desktop) is even better (where is Gemini 2, btw? I've
got 50 DM to spend :-)). And don't say you are not using any useful
system enhancements, just because they are not by Commodore (tm) and
therefore these ones don't count...

From all appearances, the 060 will rival many of the RISC CPUs...

Haynie's convo last night seemed to indicate that an A5000 would
have an M-40 or M-60-class CPU as the default, and a RISC CPU as
a plug-in option.

Gerry Mon (gerrymon@eng.umd.edu) wrote:
: >But calling something true colour just because there is no CLUT is stupid,
: >because this would then apply to a monochrome ZX81, or an Amiga displaying a 0
[...]

: Why is this stupid? Atari's definition of True Color is a good
: definition: The bits that represent the pixel represent the True
: Color of that pixel as opposed to being a pointer to a CLUT. Hence,
: they call it a True Color Mode.

Why is no lookup table better than a method that does use a lookup
table? Let's say C16 has a 16 bit palette and uses "True Colour"
and C24 has a 24 bit palette and uses a lookup table.

Now given an arbitrary images, wont C24 produce a better image just
because it has a better spread of colours and is less affected by
banding due to a greater amount of shades of a single colour?

: By that definition, the ZX81 has a 1-bit True Color mode and the
: Falcon030 has a 15/16-bit True Color mode.

: Another good term that I've heard recently is Direct Color (for True
: Color modes) and Indirect Color (for CLUT based modes).

: To me, it's much more compact and elegant to decribe all the different
: video modes using as few terms as possible. In other words, it's
: better to say 16-bit True Color and 24-bit True Color as opposed to
: inventing new names for each case (i.e. HiColor and TrueColor).

: In this way, you don't have to invent a new name as technology
: improves. All you do is append the number of bits (i.e. 48-bit True
: Color).

I think you'll find that 24 bits in the practical limit to colour
registers, as the benefits of extra shades diminish quite quickly.
I'm not too sure of any systems that actually use >24 bits for
colour, as most I've heard of use the extra bits for alpha channel
and z-plane stuff.

: And there's nothing wrong with having a definition include degenerate
: cases such as the 1-bit True Color mode. In fact, lots of
: mathematical definitions have these so-called degenerate cases.

I'd prefer TrueColour to mean an image that is photorealistic. High
colour images are close, but you can still detect banding on a 16bit
image. On a 24bit images, I'd be hard-pressed to tell the difference
between the original photon and a digitized picture.

>What's your bloody problem? The Medusa exists, which is an Atari-compatible
>040-machine - that sounds like a 040-ATARI to me ..

No - its an 040 MEDUSA. I think Atari lawyers might have
something to say if they called the machine an Atari.

It still isnt widely available nor is it Falcon compatible.
---

In any case, it does exists - and if you want one, you can get one.

What exactly do you mean by "Falcon Compatible"? As with any machine,
it will run all of the OS compliant Apps in existance just fine.
Probably some games would break, but I am unsure on this point.

Besides, if Falcon sales are as poor as you constantly whine about,
then why is Falcon Compatibility such an issue? I personally think
that ability to run stuff written by the rules is far more important.
Besides, the said a DSP card was planned and unless they are totally
out of it, they will probably use the same OS calls to access the DSP
that the Falcon does.

You can spew all the BS you want from your mouth, but no matter what *YOU* say, animation is my biggest reason to go with an A1200.

I can do 320x200 overscan 30fps Ham8 animations that look like video (with *HUGE* deltas-> the whole screen chaning).

So before you start making an opinion again about what you don't know, think about it at least.

Methinks a 25MHz 68040 emulating 68000 code may run a *little* faster than an 8MHz 68000. about 30 times faster in fact, and if your ST emulator is system legal (There are several ST emulators on the Amiga, both commercial and PD), 640*400 (that is what you meant isnt it?) will not be interlaced.
BTW, did the ST's default graphics capibilities ever evolve beyond these? I know the STE has a 12 bit palette (wow!), but what abour resoloition and colour depth? (This is not counting the Falcon, I'm just curious about the STE / TT, whatever)

The usual answer to this is 24 bit displays are much slower than, say,
8 bit displays. You've got a 3D package rendering a nice 24 bit
animation in the background, and you are trying to type something into
a word processor. It doesn't take much to realize that you aren't
going to be able to scroll around your document as fast on a 24 bit
screen as you will on a 4/8/whatever bit screen. Of course, this is a
specific example, but the same situation holds for any set of programs
where: some programs benefit from the enhanced colour resolution, and
some do not require it. The same argument applies to spacial
resolution, for similar reasons.

If all I am doing is rendering a 24 bit image, why do I have to be in 24 bit mode on the screen? just render a 24 bit image while the screen is in monochrome, and do your word processing, and then switch to 24 bit to view the image! That's what I do, except exchange "24 bit" with "16 bit"

Well, I don't see why you can't count the Falcon since it is now the
low end of the ST market, but aside from that the TT has larger
graphics modes with more colors than normal ST's. I don't exactly
know the specs though...

Ok, do I have to spell this out? Consider the following. You are running your Desktop in 720*534 in 8 colours, your paint package in 800*600 in 256 colours, and EMACS in 640*512 in 2 colours. Now lets consider the different ways of implementing this.

1) Screens.
720*534 in 8 colours uses 144180 bytes
800*600 in 256 colours uses 480000 bytes
640*512 in 2 colours uses 40960 bytes
Total usage of video memory, 665140 bytes, or 0.634 megabytes

2) Running all these in windows on a 1280*1024 24 bit screen
The screen alone uses 3932160 bytes, which is exactly 3.75 megabytes. This is before you start worrying about where you are going to store bits of overlapping windows.

The end result is pretty much the same. One uses 2/3 of a megabyte. The other uses 3 3/4 megabytes. Pretty convincing argument in favour of screens I think. Oh, and before you say 'but you dont have a 24 bit application, and a 16 bit application running', that is pretty irrelevant. 24 bit 800*600 still uses less memory than 24 bit 1280*1024

Gerry Mon (gerrymon@eng.umd.edu) wrote:
: >But calling something true colour just because there is no CLUT is stupid,
: >because this would then apply to a monochrome ZX81, or an Amiga displaying a 0
[...]

: Why is this stupid? Atari's definition of True Color is a good
: definition: The bits that represent the pixel represent the True
: Color of that pixel as opposed to being a pointer to a CLUT. Hence,
: they call it a True Color Mode.

Why is no lookup table better than a method that does use a lookup
table? Let's say C16 has a 16 bit palette and uses "True Colour"
and C24 has a 24 bit palette and uses a lookup table.
---

Aha!! No one ever said that 16-bit true color beats a CLUT 24 bit
(well, it does if you have a real small CLUT, but I believe you mean
HAM8 which seems to deliver a large number of colors on screen). What
we do say is that the X definition of True Color is much more logical.

Now given an arbitrary images, wont C24 produce a better image just
because it has a better spread of colours and is less affected by
banding due to a greater amount of shades of a single colour?
---
Sure, I guess.

: In this way, you don't have to invent a new name as technology
: improves. All you do is append the number of bits (i.e. 48-bit True
: Color).

I think you'll find that 24 bits in the practical limit to colour
registers, as the benefits of extra shades diminish quite quickly.
I'm not too sure of any systems that actually use >24 bits for
colour, as most I've heard of use the extra bits for alpha channel
and z-plane stuff.
---

I'm sure someone said 8 years ago that 8 bits was the practical limit
for color images. I agree that 24 bit is very good, but it can get
better!!

---
: And there's nothing wrong with having a definition include degenerate
: cases such as the 1-bit True Color mode. In fact, lots of
: mathematical definitions have these so-called degenerate cases.

I'd prefer TrueColour to mean an image that is photorealistic. High colour images are close, but you can still detect banding on a 16bit image. On a 24bit images, I'd be hard-pressed to tell the difference between the original photon and a digitized picture.

---

I do not consider 24-bit images to be photorealistic. Therefore, 24-bit graphics are not true color by your definition.

No. It's not useless, same with the Falcon- it's not useless.
But doesn't live up to the hype.
---

I beg to differ - don't you have to advertise to have hype? :-)

The Falcon I have is everything I expected... actually a bit more,
the larger screen area than the ST is really really great!!

Plus, I personally don't consider an 8MHZ machine to have enough OOMPH
behind it to multitask well. I will admit to having some interest in
a Falcon accel. board... but then I never seem to be satisfied with
the speed I have.

>between the original photon and a digitized picture.

That, I'm afraid depends on you'r resolution and image quality. I have seen good 256 color images that look like pictures. Likewise, a 24 bit image could potentially look very fake. This definition is rather useless as it requires a person's opinion. If you mean that true color should represent all possible colors then you are lost because there are surely more colors than 16777216. Also, if you want true color to mean all perciecvable colors then we are back to a matter of opinion. I have heard that many of the colors in 24 bit are indistinguishable. Thus we have eliminated all proposed definitions of true color from the realm of usefulness except the established one of denotating the true color of the pixel within the bitmap rather than in registers.

GM> majority of Ataris will continue to be 68K based with the STe/ST

Sure, did you expect EVERYONE to just JUMP high and shell out loads of money
the same day the Falcon was released?

The same argument is valid for Amiga 500 owners.

GM> >030+
GM>
GM> What does the plus mean? You CANT get a Falcon with a 68040. You
GM> cant even get one with proper 32 bit memory access or one that goes
GM> faster than 16 MHz.

You can get Atari compatibles with 040s.

GM> FACT: About 300 000 A1200s have been sold TO DATE. Thats what I call
GM> a userbase!

Source? I've asked for a source each time someone quoted those figures, still
hasn't got one. According to one of the biggest Amiga magazines in Sweden, only
5000 A1200 has been sold here.

GM> FACT: You can get Amigas in 020, 030 and 040 versions OUT OF THE BOX

Yep, EC020, EC030 and a VERY expensive 040.

GM> FACT: The Amiga 030 machine runs at 25 MHz - not the 16 Mhz of the
GM> Falcon

..without the important MMU, used when trying to run Linux for example ..

None of the Amigas are even close to the Falcon in pure performance though ...
(heard the word DSP before?)

You must either be talking of the 800*300 resolution in Super72 mode,
or your idea of what the term 'most applications' means is totally
different from what the rest of the computer community thinks.
You are surely not talking of editing source codes, writing texts, etc.,
because for these purposes, the Amiga surely lacks some good, flicker-free
resolutions.

Well, seems the name 'SpeedoGDOS' follows the German concept of compound words, so I'll translate it for you:

GDOS means Graphical Device Operating System, and is part of GEM's Virtual Device Interface, though not in ROM. Basically it handles output to (gosh!) graphical devices, such as printers or screens. Without this part of the OS, one usually doesn't have the ability to choose fonts in GEM etc. (well, applications got around this, but that's a different story).

Speedo is (tm) of Bitstream, this font system is distributed with X11R5, e.g..

How do you type "rm thisisAveRyDifficultFiLenameTOremove thisis_another ADD_IN_LOTS_OF_CAPS dir\ sysTem\ bin\" easily from a case sensitive shell?

Or have you tried ftping into systems that carry anime gifs that have very long directory names or got into systems where you have to use the shift key to type in all those funky MS-DOS style 8.3 filenames?

Much easier to click, click, click then delete ;-) or use a windows FTP program and click on the filename and hey-presto, it's on your hard-drive.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Chris obviously knows more than the German Amiga magazines (well, their November issues, respectively). Would you also tell us when RTG/OS4.0 will ship? I mean, I said something like 'not before CeBit'94' four months ago, and yet C= haven't proven me wrong. The same thing might happen to these vapour chipsets. Wille there also be a replacement for the soundchip? The disk I/O? I mean, both are 8 years old, aren't they? And at least the incapability of the Amiga to handle HD/ED floppies properly is annoying.

>offers
>1280*1024 24 bit non-interlaced, and much higher resoloitions, although in

^^^^^^^

Seems your infos are based on belief rather than on internal information from someone working for C= :-)

And, indeed the Workbench is very functional, it's that functional that third-party programmers write Mac/ST-like trashcans or Amiga users use third-party programs to copy files (instead of using the desktop's drag&drop).

[...]

: If all I am doing is rendering a 24 bit image, why do I have to be in 24 bit
: mode on the screen? just render a 24 bit image while the screen is in
: monochrome, and do your word processing, and then switch to 24 bit to view
: the image! That's what I do, except exchange "24 bit" with "16 bit"

And how easy is it to change resolution or colour depth on the fly? Will your old applications have to stopped or quit and then re-run to display the image?

I tend to use Text Mode on a clone for BBS or VT-102 uses as it is much faster than bitmap mode under Windows. Also, the text is rendered much larger than on a 800x600 screen. I could run it as a Window on the main desktop, but I have to do a lot of fiddling to get the aspect size correct and drop the desktop back to 16 colours to get a decent amount of speed.

Being able to flick quickly between a lo-res text screen and a high-res graphics screen is a bonus. Having to shove everything on the same screen and change resolutions and depth all the top is not a very good method in my opinion. If that was the only way of doing things, I would, like you learn to live with it.

OS/2 allows reasonable quick movement between full-screen DOS and seamless mode as well. If OS/2 forced all DOS apps to live on the same screen I would be far from happy.

First, the memory is used only once, namely for the screen itself, i.e.
a second (third, fourth, ...) application would not use more memory if
it had been started in a different screen mode.

And, the Amiga concept of screens IS nice, but it's terribly overused on
the Amiga. Why the hell does a simple 'more' replacement (muchmore)
open a screen for itself? (On the Atari, it's usually the other way
round: the standard 'more' is TOS, and the replacements work on the
desktop). And why are there even applications getting around screen mode
redirections (Amiga->DblNTSC, or whatever is redirected)?

Well, the A4000/040 has a 32bit CPU running at 25 MHz connected to it's
RAM through a 14.xx MHz(?) bus and incapable to access it in burst mode.
The CPU is running at 7/7/7/7 waitstates!!!! Now what do you call crippled?
(Not to mention that nearly all custom chips of the Amiga are 16bit,
while all Falcon custom chips are 32bit).

Personally the shift key isn't a hassle (just use caps lock), however the 8
character limits leads to some really meaningful filenames.

Mr. Oates obviously hasn't used GEM very much. Drag select also exists in GEM. But the Atari hasn't got a 'middle mouse button' (the Amiga hasn't one either, at least not the standard mice).

>|> the mouse to the OK button. hit it. Select file #2 .......

The 'confirm' option can be switched for /overwriting/deleting/copying/ in the 'Extras' menu. I usually only have the 'confirm' option set for overwriting files. Again, a widely unknown GEM feature :-)

I have no DOUBT that HAM8 can look good. I also maintain that due to it's setup, with large amounts of colour, you will get fringing and loss of colour contrast. With a 'true colour' mode (colour gun values) a more accurate colour reproduction is possible.

I have no DOUBT that for those serious about their realism when using digitised backgrounds and such, given the choice of using a HAM mode or a true colour mode with 16-bit colour encoding, they will pick the latter.

Let me say that my attempt to explain the effectiveness of true colour
is my own oppinion. Secondly, it is well known that a true colour mode, not
only saves memory with the lack of a large lookup table, but the direct
use of the colour guns reproduces better results.

Firstly, with large screen modes where the number of colours on screen
is large, it is foolish to keep a look up table of that size.
Work out the permutations of 24 bits!

Also, because the colour guns are digital to analogue, they can more
accurately reproduce colour then passing set voltages to the monitor.
There are better arguments then mine...

BZZZZZZZZZZZZZZZTTTTTTTTTT!!!!!!!!!! WRONG! Thank you for so easily
digging yourself into a hole. the correct answer is:

Since the max rez/colors is 800 x 600 x 256, run your desktop in this, using
only one screen, and you SAVE memory, since it is only 480000 bytes. If all
you NEED is 8 bit color, why run at more? that is what my post was about.

Actually, I've been using it since 1987. :) I was taking a worst case scenario where the scatered files are not next to each other. I felt that was a more accurate test of the speed of selection. I handicapped myself, so to speak. and I like having the confirming on.

Use a shell with filename completion and then shoot the bozo who used
such a ridiculous filename. :-)

>Or have you tried ftping into systems that carry anime gifs that have
>very long directory names or got into systems where you have to use
>the shift key to type in all those funky MS-DOS style 8.3 filenames?

The first problem is solved by learning how to type faster and the
second is solved by using the Caps Lock key. :-)

>Much easier to click, click, click then delete ;-) or use a windows

The only problem is when you want to delete a large number, your
finger can become numb from all of the clicking. Some systems make
it easier by allowing a drag-select with scrolling, others force
you to click each individually while holding a shift key and then
using scrollbars to move through the list. I prefer the former, but
the later seems to be more common.

>FTP program and click on the filename and hey-presto, it's on your
>hard-drive.

Or just mount the drives using NFS and drag-and-drop the icons.
Having WUArchive on your desktop can be cool... :-)

I never claimed that a True Color (or Direct Color) mode is better than a CLUT based mode. All I was talking about was Atari's definition of True Color -- which I think is a good definition.

By the way, in my opinion, there is no such thing as the perfect graphics mode. That's one of the reasons why a lot of computers offer lots of different graphics modes. You choose the one that is best suited for your particular application.

In your example above, one can easily construct an image that will look better on the C16 than on the C24. Similiarly, one can construct an image that will look better on the C24 than on the C16.

Every graphics mode has its advantages and drawbacks.

As a general rule of thumb, modes with 8 or less bits per pixel are usually CLUT based modes. Modes with 16 bits or more are usually True Color modes (i.e. no CLUT). With 8 bits or less, True Color modes don't look too good. When you get to 16-bits per pixel, the CLUT becomes too large -- this causes the table look-up times to become too excessive so it's better to bypass the CLUT and have the bits directly specify the color.

>
>I'd prefer TrueColour to mean an image that is photorealistic. High
>colour images are close, but you can still detect banding on a 16bit

>

Personally, I don't like scientific definitions that are based on subjective opinion. For some people, 16-bits is close enough to photo-realistic. For others, 24-bits isn't enough (I've heard some Mac people say this when doing DTP work).

I think the key is just to keep in mind that people in different fields/areas have different terminologies and not get so nit-picky with these definitions.

For example, when I'm talking with Mac and PC people, I assume that True Color means 24-bits per pixel. When I'm talking with Atari people, I assume that True Color means no CLUT. By the way, I don't think Atari is the only one that uses this definition. If I remember correctly, the NeXT computer also used this terminology to describe a 12-bit per pixel mode on one of their early color NeXTstations.

|>

Just a little point...

The paint program happens to be using 256 shades ranging in a 24-bit fade from yellow to cyan (For strange image-processing reasons :-). Now, unless you want EMACS to have blue text on a yellow background (YEUCH!) or vice-versa, then you're going to need at least 258 colours...

And to reply to your other post, about why you'd want to run Emacs on a 24-bit screen, imagine that you want to view 24-bit stuff (Or, say, 8-bit stuff, in which case you could use an 8-bit screen) AT THE SAME TIME as using Emacs.

Without a "screens" system like the Amigas (However it's implemented, and I know that some other machines/OSes do it), you WILL have to run Emacs in 8/24-bit colour, NOT monochrome...

Anyway, most of this bickering is irrelevent to me. I've still got an A500+... (640*512*16 interlaced is MUCH better than any of these other modes, anyway (Does that REALLY need a smiley? Well, considering how this argument's currently being treated by BOTH sides, perhaps it does...)).

Why don't you all just shut up? HAM-8's pseudo 18-bit colour is better than 16-bit Direct/True colour for displaying pictures, pre-rendered ANIMs, etc., but running a desktop in it is a nightmare, etc. Use whichever's best for what you want! (My desktop's still 4-colour, despite the fact that it could be more, because I don't happen to like 16 million colour desktops, but that's JUST MY OPINION!). Why doesn't everybody just stop shouting at each other, and discuss something productive instead? It's no wonder Amiga and Atari owners have such a bad reputation... Why not discuss thing sensibly? Why must EVERYTHING degenerate into a holy war? Sure, the Amiga's better than the Falcon. And the Falcon's better than the Amiga, too! It DEPENDS WHAT YOU WANT TO DO WITH IT!!!

Oh well, I suppose I just sit back and wait to get flamed now... :-(

But then I have to fiddle about burying windows to find the app I want, update on the desktop and EMACS would be slower. everything would be tied to the same palette (pretty useless for the paint program) and you would still have to use memory to save hidden parts of windows. No, I'm sorry, you'r argument just does not work.

Ehem, ever heard of interleaving techniques? With those, it is quite possible to have many more colours than the 16 bit mode provides. Anti-flickering and colour-determination is not trivial while using this technique, though, so I guess it's only useful for viewing pictures (reminds me of an Amiga graphics mode, hehe).

>an F030 and you can add stuff as you can afford it.

OK, let's calculate: (2.50 DM = 1 UKpound, 1.65 DM = 1 US$)

My Falcon had cost me 2900 DM, including BlowUp030 Hard II, 4 megs
of RAM and a 170 meg SCSI drive, all in a tower casing.
For 750 DM I'll get a Mighty Sonic 32, for 300 DM I'll get 4 megs
of FastRAM.

This gives me: a 32 MHz/32bit computer w/ 4 megs ST/4 megs FastRAM,
screen resolutions up to 1280*1024 (in 16 colours, >60 Hz interlaced),
up to 800*608 in 16 bit mode (well I could go some higher, but the
flickering makes me mad) and 1024*768 w/ 256 colours (>60 Hz interlaced).
Oh yes, I forgot to mention the disk drive accessing high density at
double speed :-).
And THIS Falcon IS expandable, for the MightySonic has a VMEbus
(well, it is still limited to having 4 graphics boards at the same time...)

OK, heading for the A4000/030. With 8 megs of RAM it would cost about
2300 DM. Add an SCSI host adaptor (Oktagon 4008: 300 DM), a 16 bit audio
card (600 DM), and a 170 meg hard disk (400 DM).

Falcon: A4000/030:
2900 2300
750 300

300 600
---- 400
3950 ----
3600

350 DM difference! But don't forget that you will not get a DSP or a
real 030 with your A4000. I think that these are worth the extra cost.
And the Falcon is faster, of course.

> Read this and weep Falcon owners - LOOK : SOFTWARE.
>
> You dont see a lot of this on the Falcon as it has proved so
>unpopular with the computer buying public that NOONE BOTHERS TO MAKE
>SOFTWARE FOR IT!

Strange argument for someone from the UK. Go look into 'Atari ST user'.
(Well, not that I think this mag is truly professional, but I suppose
you can't read German, otherwise I would send you an issue of 'ST
Computer'). Or for games, look into some other mag available in the UK.

And the Amiga sound subsystem is really 7 bit, because the 8th bit isn't very much of it's own.

>There is NO DOUBT that a HAM8 picture is closer to a 24-bit
>picture than a Falcon 15/16 bit screen - and all with half the
>memory - very useful for real time animations.

There is NO DOUBT that the earth is disk-shaped.

I have seen pictures in both modes, and while HAM8 adds some blurry edges to every picture, 16bit has visible 'steps' at sharp contrasts. Not a big difference, IMHO.

Show me an Atari emulator that supports AGA and graphics boards such
as the Picasso II, and I know someone who is going to buy it.
BTW, you claimed there was no software for the Falcon, do the
ST programs not count? Why not? Is it illegal to use Final Copy II on
the A4000 because it runs on an A2000 also?

OK, but why emulating a Mac Plus when one could emulate a Mac II/LC/whatever?
It's basically the same.

>BTW, did the ST's default graphics capibilities ever evolve beyond these? I know
>the STE has a 12 bit palette (wow!), but what abour resoloition and colour depth?
>(This is not counting the Falcon, I'm just curious about the STE / TT, whatever)

ALL STs have retargetable graphics. There are several hardware hacks for
standard STs allowing them to display higher resolutions (basically,
it means 'adding an overscan mode', and the OS makes use of this expansion.
With the TT (1280*960, b/w, 72Hz; and VGA modes) came the VME slot, and
many graphics boards have been developed for this one. And some months
ago, a project started called 'Volksfarben 4000', allowing every ST
user to hook a ET4000 PC graphics board into his machine (well,
if he has enough space left, otherwise he'd need a bigger case).
Enough of that?

To Robert Brown:

I'm certainly willing to let it drop. I started this by saying that I don't like screens, not "SCREENS ARE USELESS" as some people heard, and I got attacked for it, and was defending myself. There have (finally) been some reasonable answers for why SOMEONE might want to use screens, but I have never experienced one of these situations. My real gripe with Amiga screens is that I like to see everything that I'm doing at once. There. Plain and simple. If I had a fast enough computer with enough VRAM, I would run a 1200 x 900 24 bit color display for everything. BTW, as far as screens in general goes, I think the Mac way is very cool. Plug in a second video card, buy a second monitor, and TWO screens (or more) at once. Most of the programmers where I used to work had a 13 or 16 inch color monitor for testing graphics code, and a portrait or 20' monochrome screen for text editing. That is the best thing about Mac graphics. (p.s. I'm no Mac fan. For every "nice" thing I have to say about Macs, there are 3 pages of problems...)

~Chris

>(reminds me of an Amiga graphics mode, hehe).
>
I think this is what you are talking about...
I figured out how Videl works, or at least figured out mathematically
how to get 504063 colors on a Falcon. On screen 1, draw the image in a normal
24 bit to 16 bit conversion. On screen 2, draw the same picture, but if the
24 bit RBG value is haflway between the value on screen1 and the next higher
value, add one to the component(s) that is diferent. When all the permuations
of this are added up, it comes exaclty to 504,063 as stated in the VIDEL
screen.

Oh yeah. Page flip screens 1 and 2... ;) Is this the interleaving you are
talking about?

Whoever said "040 Falcon"? I can only see "040 Atari".

Of course you could do it with an 040 Amiga - just as you can emulate
a Mac on an ST. Doesn't mean the Mac isn't a Mac, and doesn't mean
the Medusa isn't an "040 Atari", or "040 Atari-compat" if that makes
you feel any better.

Ah, at least you've finally admitted that it EXISTS.

Gavan. Even most Atari owners don't have time for this group (me included).
Is your life so sparse or your non-life (computers) so lacking that you find
time to postulate the existence and non-existence of every Atari-related
product?

So you'd call an A500 in a tower case with a GVP speeder board a
030 GVP, eh?

> It still isnt widely available nor is it Falcon compatible.

Availability is there. just send an old ST to the Swiss address.
Or did you mean 'only few have it'? There are not that many people
owning an A4000/040 in the world either, although I know three
of them (but, hey, this is Germany, where both computers are
very popular, though you might not any longer find one in
any shop in this city, not even a CD^32 games machine).

Seems you haven't got the point. file[1-6] obviously were EXAMPLES for names, not the names themselves. It would be quite stupid typing the long list of filenames while you could easily type rm file[1-6] using bash under MiNT (as I do). Remember: MiNT is not a CLI, it's a POSIX compliant, and one can easily compile any Unix shell for it or take ready-to-run shells from any ftp site with pub/atari/GNU directory.

On the mac at least, all you have to do is open up the monitor preferences thingy and change to 24 bit. The screen goes black for an instant and then reapears in 24 bit useable by all programs immediately. This probably is not the case for old GEM programs, but obviously it is possible.

I dont want my programs to have their palettes switched off. I like to be able to see all my programs at the same time, in their correct resoloutions, using their correct palettes.
I also dont want to waste money buying 16 megabytes of RAM to achieve less functionallity than I currently get with 6.

*FLAME ON*
I think, you don't know what you are talking about, so
ONCE AGAIN: STOP TALKING SHIT !!!
the falcon uses normally a 15bit mode with 5bit R, 5bit G, 5bit B
and there is a special 16bit mode which uses 6bit G, but this
isn't very helpful for normal pictures (only for video applications
with croma key (I hope the spelling is right))
This was no insult to all F030, but a explanation to some
stupid guys around here.

*FLAME OFF*
To all others: please stop writing articles to Xavier, he isn't
worth the effort !

Stephan (still an amiga user...)

Chris, why would anyone in their right mind go to a 24-bit video mode to
run an 8 color, a 256 color, and a monochrome application?

Sure, if they do 1280x1024x256 colors, they use over 1MB, but guess what?
Even PC videocards routinely come with 1MB of VRAM! Geez.

And if it runs too slow, well... either:

1) buy a faster computer,
2) change the programs you're running.

Is this the same Chris Brown who said he liked X better than Amiga or Atari
GUIs?

How do you do screens on your favorite X-terminal? Have you ever run a
program on an X-terminal (say, xv?) that uses the full palette of an
8-bit video display? It's fun... see, you top the window and it's palette
takes over the system. When you top something else, it's palette takes
over for xv's.

What's my point, you may be asking yourself, as you dig through your book on
Xtoolkit to see if there are no screens...?

Well, why would anyone want to do a raytracing and require that they have to
see it as it would look "for real" while it is running in the background?
And if they just bring the window to the top to peek at it, it's palette
takes over. Then they lower it, and life resumes for the Emacs session.

I find this hilarious. Go get a firm grasp of the topic before you do stuff
like this...

Not on the version of XV I have. It takes what colours it can and keeps them.

|>
|> What's my point, you may be asking yourself, as you dig through your book on
|> Xtoolkit to see if there are no screens...?

I am fully aware that there are no screens in X. I like X as a user interface because of it's configurability. The applications I run under Unix are typically not graphically intensive, and I could quite happily do most of them on a VT100. X lets me have them all at once, and it provides the basis for a nice UI (under TWM) for most things I need it for. However, any graphical stuff I want to do I use my Amiga for, since the Amiga is much better for this sort of thing, and this is partly due to it's screens system.

|>
|> Well, why would anyone want to do a raytracing and require that they have to

Because you are still wasting memory saving bits of windows and running EMACS in needlessly high colour modes. Is this really so hard to understand?

If the palette thing doesnt bother you, then fine. It does me.

|>
|> I find this hilarious. Go get a firm grasp of the topic before you do stuff
|> like this...

Just because I like one feature of X & TWM (It's user interface and configurability) doesnt mean I automatically don't like all other features of all other operating systems and user interfaces. The Amiga's screens system is incredibly powerful, and if you can't see that, then you are being incredibly short sighted.

Your refering to colormaps and not screens; just to make things clear.
The example you give has nothing to do with screens.

Yes it can. The human eye/brain is more sensitive to green than any
other primary color: red & blue. Humans have the least amount of
sensitivity to blue. Therefore, if makes sense to have more bits for
green to accomadate(sp?) humans' sensitivity to green.

One thing to note, however, is that human sensitivity to red light
is pretty close to green. Therefore, if I had a choice of the
number of bits to give each color (with 16 bits total to use), I'd
have the following:

R - 6 bits
G - 6 bits
B - 4 bits

What I think alot of people are doing is thinking of light/color
on a linear scale, but human perception is non-linear and varies
depending on the color and intensity of the light.

The -perfect switch tells Xv says to use its own colormap. If you do not
give the option, than it will take as many colors it can allocate from
the default colormap (but will not over-write already allocated
colors). You can use the -ncols option to limit Xv's hogging of
colors.

I believe Xv 3.00 has different command-line options to give the same
results. Consult the manpage.

>I am fully aware that there are no screens in X. I like X as a user interface

Correction: the X protocal DOES support multiple screens (and
displays). It is up to your X-terminal/workstation, if it will allow
multiple screens (i.e. it has the hardware or software). I've seen
some versions of Sun workstations support a monochrome and color screen
on the same display (you use the mouse to switch screens).

Er, quite simple really. You drag the front screen down, and you will be able to
see any other screens behind it. If you have 2 320*256 screens, but are viewing
them in 640*512, or 800*600, or whatever, you can even see each in it's entirety.
Simple really :-)

Well, to be honest: GIF/TGA/Multiviewers usually use 240 colours for the
picture in 8 bit modes, leaving the desktop colours untouched.
And, as I have stated before, the screen concept IS nice, but it's used
too much on the Amiga. The plus of having all those things on-screen at
once is the possibility to use the drag&drop protocol (and TOS 5 has an
'iconify' option for windows, thank Cthulhu), I just can't imagine how
to use drag&drop between screens.

Right. I read an article in the German mag ST Computer some months ago.
Using this technique properly one can also expand 16->121 colours etc.
Gotta look it up for details.

I�m frightened !

Ouch ! Thanks to god, that you are no amiga-developer (just joking)
but someone had the nice idea to put an Icon/Window/Menu on the
Workbech, so that things can be dropped there. I know that this is
1.) only one way
2.) difficult between two applications
but most of the drag&drop things are files/dirs/etc. which
can be easily handled this way.

Wow! someone who LIKES the A4000/040. Personally, I think its a
bit of a let down. It doesn`t have SCSI as standard, hasn`t improved
the sound over the A3000 and is grossly over-priced. The only thing
it has going for it is that fact that you can get an 040 as
standard. The AGA chipset is nice, but you get that in an A1200 for
a fraction of the price. Considering Apple are supposed to be
releasing a MAC 040 machine for the 900 UKP price, I think commodore
had better get their finger out and sell the A4000/040 for around
the same price. At 900 UKP I`d consider it a good machine, but at
the present 2000 UKP mark it really doesnt cut it.

For many people, an A3000 or A2000 with an 040 card (you can get
them at up to 35Mhz) and a gfx board (like a Retina) is a MUCH
better buy costing much less.

Gavan

>I fail to see when I'd ever need such a setup... Why not just 3 24 bit
>windows? 24 bit can easily "emulate" the other two...

When the Amiga multitasks, each process can open a bitmapped
screen totally independantly and write to that screen directly. The
copper hardware allows the visible screen (the VDU display) to be
drawn from any areas of memory so you can slide screeens down and
see the program behind drawing to its screen. (The old 8-bit Ataris
could do this soft of thing too - altough support wasnt in the OS
for it).

It means you can open a single bitplane screen to use as a shell,
a 3 bitplane screen for your desktop etc etc. You can thus have
loads of different screens, but using the minimum amount of memory
possible. This makes multitasking much easier, even on a cheap 14"
monitor.

The alternative is to have a massive workstation-like screen
with say, 1024x1024 and 24 bit so that you can fit many windows on
screen at once and can also have fulfil the colour pallettes needed
by each `screen`. Fine, but large monitors cost lots of dosh, and
the memory and performance overhead needed to manage the screen is
large.

I think that for low-cost personal systems running on relatively
small computers, the screens system is a MUCH better option. Amiga
users can always get a 24 bit card doing 1024x1024 if they really
need it (assuming they have a Zorro slot machine).

Its called MULTITASKING. When you are doing this, you will most
probably want to see different things running at different times.
Sometimes, the apps will run in a standard workbench (desktop)
window, but occasionally apps will need things like hi-res,
hi-colour screeens and rather than run the whole machine in the
highest res mode and spend lots of CPU time managing the windows,
screens allow each process to have its own independent screen -
saving on a lot of window management and multitasking much faster.

I think the problem is that `True Colour` has become a widespread
word for 24-bit graphics, as they are what is required for
photorealistic images. It seems that some company has copyrighted
`TrueColour` or something similar as a way of describing a system
where the value of a pixel is actually a digital representation of
the colour of the pixel, rather then a pointer to a CLUT.

>I'm sure someone said 8 years ago that 8 bits was the practical limit
>for color images. I agree that 24 bit is very good, but it can get
>better!!

Apparently, the human eye can only distinguish about 300K colours
and 256 greyscales. Thus 24-bit may be overkill for colours but
needed for accurate greyscale reproduction. (The AGA chipset can do
proper 256 greylevel gfx by the way!) Since 24 bits is a nice handy
computer number (1 byte per primary colour) I think it has become
the standard for photrealistic work (at a professional level).

I doubt that anyone would percieve much of a difference, even
with 48 bit colour but the actual tech stats such as dynamic range
would be better so it could be useful for certain applications.

Ther Pseudo 18-bit of HAM8 colour seems to be good enough for the
majority of people. I`m sure the 15/16 bit mode is good too, but I
doubt that 32 intensity levels would be much use for anything
serious.

>GM> WHAT installed base - 20 to 30 thousand Falcons?? The vast
>GM> majority of Ataris will continue to be 68K based with the STe/ST

>Sure, did you expect EVERYONE to just JUMP high and shell out loads of money
>the same day the Falcon was released?

Exactly! The Falcon is WAY to expensive to be a viable updgrade
for many ST owners.

>The same argument is valid for Amiga 500 owners.

WRONG. The A1200 now can be got for 260UKP. Thats a lot LESS than
many A500/A600 owners paid for their machines at the time they
bought them (They used to cost 400 UKP). The A1200 is actually MORE
affordable than any previous entry level Amiga and is far more
powerful and with more potential than an A500.

>GM> >030+
>GM> What does the plus mean? You CANT get a Falcon with a 68040. You
>GM> cant even get one with proper 32 bit memory access or one that goes
>GM> faster than 16 MHz.

>You can get Atari compatibles with 040s.

You dont get Falcons with 040s. As for adding an 040, well you
could do that with an A500 if you really wanted to (little point
though). That doesnt mean that the A500 is an 040 machine. You still
cant buy an ATARI 040 machine and that means a lot to most consumers
who won`t be into buying 3rd party clones - This is NOT the IBM PC
compatible market we`re talking about here.

>GM> FACT: About 300 000 A1200s have been sold TO DATE. Thats what I call
>GM> a userbase!

>Source? I've asked for a source each time someone quoted those figures, still
>hasn't got one. According to one of the biggest Amiga magazines in Sweden, only
>5000 A1200 has been sold here.

Recent figures form C= in the UK mags talk of around 120000 in the
UK alone with (supposedly) 100000 sales at Xmas (Doubtful - I
reckon the CD32 will severly curtail A1200 sales). I cant speak for
the rest of Europe. Ask Stefan Boberg - hwe develops commerical
software so he should know what the deal is.

>GM> FACT: You can get Amigas in 020, 030 and 040 versions OUT OF THE BOX

>Yep, EC020, EC030 and a VERY expensive 040.

Yes, the A4000/040 is FAR too expensive for what you get. The only thing its got going for it is the 040. As the top Amiga, Its dissapointingly overpriced. Same goes for the Falcon IMO.

>GM> FACT: The Amiga 030 machine runs at 25 MHz - not the 16 Mhz of the
>GM> Falcon

>..without the important MMU, used when trying to run Linux for example ..

If an MMU is important (and to most Amiga users it ISN`T - more speed is more useful) then buying an Amiga 3000 would be a good move. It`s very cheap these days and is ideal for running the one worthwhile MMU-using application - LINUX. Alternatively, all of the 4 or 5 50MHz 030 upgrades for the A1200 have a full MMU (for what its worth).

>None of the Amigas are even close to the Falcon in pure performance though ...
>(heard the word DSP before?)

Excellent for Digital Signal Processing and fractal drawing.
Useless for DTP, compiling, databases ......

>GM> to mention expansion slots which take cards like True 24 bit
>GM> displays, 040 expansions etc.)

>3x the Falcons power ... sure .. back that statement up, fool.

Well the increased clock speed alone should yield a 60% increase.
When you take into account 32 bit access, no chip contention and
burst mode, I think 3x is reasonable, maybe even a little
conservative.

Since noone has defintatively proven the advantages of 32 bit
access and no contention in the A1200, it could be hard to prove
this though.

I will say that since an A1200 with 32bit fastram runs 2x faster
than one with chipram, contention DOES play a part in overall speed.
In addition, when you add 16-bit fastram to an A1200 via the PCMCIA
slot (this is NOT recommended, its more expensive than a proper
32-bit expansion), the machine runs at half the speed of a 32-bit
fastram machine. Therefore, 32 vs 16 bit access would appear to also
be an issue.

>GM> >>FRONTIER ALIEN BREED II URIDIUM 2 HIRED GUNS: Amiga Power!

>GM> Read this and weep Falcon owners - LOOK : SOFTWARE.
>GM>
>GM> You dont see a lot of this on the Falcon as it has proved so
>GM> unpopular with the computer buying public that NOONE BOTHERS TO MAKE
>GM> SOFTWARE FOR IT!

>Yeah .. wow ... I want games .. sure ... NOT ...

>To play games - I go for the Jaguar.

Let me add - SYNDICATE, SPACE HULK, WING COMMANDER, DESERT STRIKE,
TFX, INFERNO ....

All these games could be done just as well on a Falcon, but
almost certainly wont be. If you want to pay extra to buy another
games system then fine, but I would like to play games as well as
program and raytrace on my computer. Its called `added functionality`

PS. Apologies about FRONTIER - I believe an ST version will be coming out (Dont know if it will run on the Falcon though)

>GM> when challenged about the shortcomings of the Falcon.

>100% of the OS compatible Software will (ofcourse) run, it's not an Amiga you
>know ...

Will it - what about the incompatible MMU and larger caches with
copyback mode? It IS possible for software to be 100% OS legal and
still fail on a different version of the CPU. As I recall, earlier
versions of TOS were incompatible with anything other than a 68000
and they were of course `OS Legal!`

>If it exists? Why not read messages from those who have ordered (and got) one
>before you even reply, fool.

Ok, anyone who has this machine please post and tell us about how
compatible it is.

>GM> Seems to me that even IF this mythical machine exists (a big IF),
>GM> people who want an 040 machine will buy an A4000/040 or a Mac Quadra.

>A4000/040? I would rahter buy a PENTIUM at that AWFUL price!!!

The Pentium is a much better bet as the A4000/040 is so
overpriced. Still, at least you can get an official 040 Amiga and
there is certainly scope for price reduction - remember that the
A3000 was over 3000 UKP when it first came out and can now be bought
at around 1000 UKP or less.

>GM> BTW _ is this machine actually FALCON compatible - or is it just an
>GM> ST with an 040 processor - there is a BIG difference.

>Falcon compatible? Who said that?

Well, you claim that the Falcon is now the base machine so the
ST/TT range is now obsolete. Therefore, this machine is an clone of
an obsolete machine. I doubt that this machine will be compatible
with any of the VIDEL tricks you keep going on about (which is why I
pointed out that Atari only give 320x200 as the maz 15/16 bit mode
resolution, and that 640x480x256 is the official OS legal max res of
the Falcon). It will also need an add-on DSP to run falcon DSP
software (of course) and even then the implementation might not be
100% compatible.

Still no 040 Falcon!

>GM> cut it)

>The A1200 is totally USELESS that is.

If you want to do animated, rendered sequences of anything more
than a couple of seconds neither the Falcon or base A1200 are a good
choice. You could do them, but it would take AGES. Better to add (or
buy a machine with) a 68030 at 50Mhz at least, or preferrably the
fastest 040 you can get your hands on. Make sure you get a fast FPU
if you are using and 020 or 030.

>GM> professionally. For personal users, replay off hard disk (or CD
>GM> using MPEG) is a much better option.

>Ah .. MPEG .. like Brainstorm has done in software on the Falcon using the DSP?

Now let me get this clear? Someone has done FULL SPEED MPEG using
the Falcon DSP? That is impressive. I have an MPEG decoder for my
A1200, but of course it can only DECODE the MPEG data into frames
slowly, not play them in real time.

If it is true, Falcon owners can buy a CD ROM drive and enjoy
digital video CDs (if they are MPEG standard). I think Amiga owners
will have to make do with a CD32 and MPEG module at around 500 UKP
the lot.

>GM> and higher resolution than the `16-bit` (actually, its only really
>GM> as usable as 15-bit since the extra green level isnt much use on its

>Fool. It gives an extra shade of green, quite useful. (Or you can use it as an
>overlay bit, for video titling)

Hmmm, 32767 variations on green tints? I dont think that you can
claim that there are twice as many USEFUL colours with 16 bit than
with 15 bit. The overlay bit would be useful, though for video
titling your best bet is an Amiga - its one of its specialities
(like midi software on the ST).

>GM> own). There is NO DOUBT that a HAM8 picture is closer to a 24-bit

rickard_troedsson@troed.ct.se (Rickard Troedsson) writes about
Re: The final word on A1200 vs Falcon ....

>...but when HAM shows its "fringes", people just turn away.

Fringing could be a big problem with the old ECS HAM (HAM6) but with
HAM8 it is much less prevalent. Higher resolutions and Composite
encoding tend to eliminate the fringing effect.

HAM fringes coz it can take up to 3 adjacent pixels to change
colour completely (If you dont use a base register, that it). A PAL
tv signal can only change colours every four pixels (tho` it can
change intensity on every pixel) so it is not entirely free of
smears either.

The thing is, at resolutions of 640x512 +o/s , and 25fps these
defects are unnoticable.

Conclusion: HAM8 can produce pictures of AT LEAST the quality of
broadcast PAL TV.

Actually, HAM8 can go to 1280x512 +o/s pixels, making it SUPERIOR to
tv by far.

Sure RGB can make sharper transitions, but resolution and colour is
also important. Also, in real life many color changes are gradual
and so HAM8 doesnt have any problems dealing with things like
graduated flesh tones etc.

>GM> Simply put, the more colours you can have to choose from and on
>GM> screen, the better your picture will look. HAM8 has a true 24-bit
>GM> pallette and 18 bit onscreen, so will look better than the 15/16 bit

>18 bit onscreen? Fool. HAM has 8 bit onscreen .. *8* bit!

No. Ham8 is pseudo 18 bit. It USES 8 bits per pixel but the Hold
And Modify circuitry allows it to emulate 18 bit colour. (with a
24-bit base palette)

>GM> purposes HAM8 is closer. Its very hard to tell the difference

>Wanna bet?

Yes.

>(Not to mention that nearly all custom chips of the Amiga are 16bit,
>while all Falcon custom chips are 32bit).

I think you are thinking of CHIP RAM here. AFAIK the A4000
access its 32 bit FAST RAM at a full 25Mhz. Wait states may be
imposed if the speed of the ram chips is too slow.

Of course, the Falcon has wait states imposed over all of its
RAM dues to the lack of exclusive processor RAM. I think that the
need to do 2x16 bit fetches when the caches miss may well impose a
wait state or two also.

>it's setup, with large amounts of colour, you will get fringing and
>loss of colour contrast. With a 'true colour' mode (colour gun values)
>a more accurate colour reproduction is possible.

`True Colour` has nothing to do with it. Even with a 256 colour
CLUT screen you can get a sharp transition between adjacent pixels.
The superiority of HAM8 ovewr 15/16 bit `True colour` lies in the
fact that there are four to eight times as many colours to choose
from and that you get a 24-bit palette to pick from.

I would say that artists would prefer to work in the `true
colour` mode of the Falcon as HAM8 would be a pain to paint in.
However, as a display medium for static pictures and for animations,
HAM8 should be superior.

Of course, the 15/16 mode of the Falcon is better when the CPU
is doing real time movement of graphics data - hence it would be
easier to do an arcade game in 15/16 than HAM8. Also, the 15/16 mode
would be superior for vector demos and the like.

The AGA chipset can of course provide 256 grey levels on a CLUT
screen, whereas the Falcon can only deliver 32, so for mono work the
Amiga is far better.

What it boils down to is..

Do you NEED total individual pixel addressability?
- go for Falcon

Do you NEED lots of colours, 24 bit palette, 256 grey levels?
- go for AGA

>would NEED to have a 24 bit screen, an 8 bit screen, etc. open simultaneously.

Because the large screen/24 bit approach requires you to have
open , say, a 1024x1024 screen upon which all your applications run.
Even if you are using only a text editor, it will have to display on
the 24 bit screen - causing a system overhead which Amiga screens
avoid. This makes for more efficient multitasking.

>And the Falcon is faster, of course.

Wow! The A4000/030 doesnt have a REAL 030. I guess users just
imagine that software is running on it.

I cant comment on your pricing, but I doubt it would hold true
in the UK even if you could get hold of half the stuff you mention.
I`ve never heard of this `Mighty Sonic 32` - is it some kind of
accelerator card? Does the 32 refer to a 32Mhz clock speed or the
fact that you can now access RAM 32 bits at a time from the CPU?
I`ve never heard of a Falcon Tower before either.

Lets not forget you`ve just parted with a huge amount of cash,
whichever system youve gone for. I think I`d rather just get a nice
cheap A1200 and when I could afford it add a CSA 12-guage or ICD
Viper card and some ram giving me a 50 Mhz 030 /w MMU and 50 Mhz
FPU, a SCSI I or II interface and up to 128 megs RAM. This all comes
on a simple card which plugs in below the A1200.

>And THIS Falcon IS expandable, for the MightySonic has a VMEbus
>(well, it is still limited to having 4 graphics boards at the same time...)

Thats the VME standard bus? Just how good is the ST at using
peripherals on this bus? Presumably they`ll need special drivers to
use them, so you can`t just take any standard VME card. I`d guess
that the A4000 ZorroIII and video slots offer much more in the way
of useful, USEABLE expansion cards.

>Strange argument for someone from the UK. Go look into 'Atari ST user'.
>(Well, not that I think this mag is truly professional, but I suppose
>you can't read German, otherwise I would send you an issue of 'ST
>Computer'). Or for games, look into some other mag available in the UK.

There is no arguement here. For games, the Amiga wipes the floor
with the Falcon, for applications software (excluding specialist
things like MIDI) it has more choice (in the UK anyway) and in the
specialist field of graphics and video it blows the Falcon away.
Only in the MIDI field can the Falcon boast a wider range of
software.

>That's how slideshows work. MPEG etc. use delta-frames, one thing impossible
>in HAM8.

No, delta frames can be used in ham8, tho` since its already
pretty compact, they arent as effective as might be hoped. An
animation IS just a slideshow - albeit a very fast one.

>> In all these cases HAM8 is a better bet as it offers more colours
>>and higher resolution than the `16-bit` (actually, its only really
>>as usable as 15-bit since the extra green level isnt much use on its
>>own).

>And the Amiga sound subsystem is really 7 bit, because the 8th bit
>isn't very much of it's own.

The eighth bit doubles the dynamic range of the sound. Adding one
extra level to just one of the primary colour components will NOT
double the dynamic range of the picture, it`ll just give you more
variations of green tints (in this case).

BTW . I think that the original poster was superimposing computer
graphics, in real time, over existing digitized backgrounds. In this case, a
direct-colour mapped mode would give an advantage over HAM8, tho`
its a very uncommon form of computer animation.

No, whenever I come back up to visit university I like to log on
to my old account in the afternoon and kill a few hours winding up
Atari owners. I merely asked if, given the record of crap spewed out
by RT, this could be believed.

Lets face it, if we all sat around doing work and study NONE of
the comp.sys groups would have any postings.

>GM> Dream on Rickard. Who the hell would want such a machine if its
>GM> not an official Atari release? Just what software will even RUN on
>GM> the machine? Does it actually exist? - You seem to make things up
>GM> when challenged about the shortcomings of the Falcon.

>100% of the OS compatible Software will (ofcourse) run, it's not an Amiga you
>know ...

Will it - what about the incompatible MMU and larger caches with
copyback mode? It IS possible for software to be 100% OS legal and
still fail on a different version of the CPU. As I recall, earlier
versions of TOS were incompatible with anything other than a 68000
and they were of course `OS Legal!`
------------------------------

They wern't "OS legal", they were the OS!! There is a difference
between APPS running on topof the OS and the OS itself. The OS is
allowed to do whatever dirty work it has to to implement system calls,
while the (should!!) only go through system calls. Therefore all of
the legal apps should work on any ST.

>If it exists? Why not read messages from those who have ordered (and got) one
>before you even reply, fool.

Ok, anyone who has this machine please post and tell us about how
compatible it is.
------------------------------

Hey, if I had that kinda money, I'd have a 3DO!! :-)

>GM> Seems to me that even IF this mythical machine exists (a big IF),
>GM> people who want an 040 machine will buy an A4000/040 or a Mac Quadra.

>A4000/040? I would rahter buy a PENTIUM at that AWFUL price!!!

The Pentium is a much better bet as the A4000/040 is so
overpriced. Still, at least you can get an official 040 Amiga and
there is certainly scope for price reduction - remember that the
A3000 was over 3000 UKP when it first came out and can now be bought
at around 1000 UKP or less.
------------------------------

I'd wait for power PC machines, myself... but then I might have a
really long wait!! Hmm, perhaps a PowerPC upgrade for my Falcon!!

---
>GM> BTW _ is this machine actually FALCON compatible - or is it just an
>GM> ST with an 040 processor - there is a BIG difference.

>Falcon compatible? Who said that?

Well, you claim that the Falcon is now the base machine so the
ST/TT range is now obsolete. Therefore, this machine is an clone of
an obsolete machine. I doubt that this machine will be compatible
with any of the VIDEL tricks you keep going on about (which is why I
pointed out that Atari only give 320x200 as the maz 15/16 bit mode
resolution, and that 640x480x256 is the official OS legal max res of
the Falcon). It will also need an add-on DSP to run falcon DSP
software (of course) and even then the implementation might not be
100% compatible.
---

Ahh, but most apps don't care, they'll run in whatever rez you put
them in. Even most painting programs work in other rezes (?) if you
want them to.

The DSP is a good point, although they said they were going to come
out with a card. Since tehre are also system calls to access the DSP,
I don't think it would be hard at all to come out with a 100%
compatible DSP card (provided it uses the same chip, or possibly the
96001)

Still no 040 Falcon!
---

Close enough... it runs most software really fast with a large screen.
I wonder about audio in, though.... Besides, I am willing to hold out
for a PowerPC Falcon.

Quite stupid, but amusing. You obviously haven't had much of biological education, and haven't bothered reading articles on graphics boards and differences between them:

Human eyes have a higher capability to differ between levels of green than they have with levels of blue or red. This seems to be a survival thing, to make it easier to detect snakes between leaves or something.
Thus 16 bit IS different from 15 bit.

That depends on "full speed" .. I think their figures was 17fps or something in
full screen .. ofcourse you could use a smaller screen though ..

But I agree, realtime MPEG decoding/coding IS very impressive! (Remember that
the 16MIPS figure of the DSP is for sequencial coding, using parallell
techniques you should be able to do 96 (MOPS))

The DSP *IS* used for several applications - something you seem to forget
everytime you bring the issue of SPEED up ..

I think when you say more efficient multitasking, what you really mean is
that the video updates should come quicker because fewer bitplanes are
involved?

The idea behind screens is nice.. and I think it is a nice advantage the
Amiga has over most other machines, however, I do think it is important
to remember that screens (as a concept) tend to work differently if you
have a video card installed in many cases (i.e., cannot drag one screen
down halfway to see part of another).

The other thing is that since the rest of the world is using the other,
more prevalent methods.... i.e., the big 24-bit screen approach. Because
this is so prevalent, it will eventually become so affordable to implement
this that I believe that cost and "resources used" won't be a factor
in the next 3-5 years when talking about 24-bit displays.

(think about how programmers used to fight to fit code in 48k and now we
routinely work on 8MB and 16MB machines...)

## 2749. just a little note

Just a little highlight to contrast all this boring tech-talk.

As a longtime Amiga user, and also owner of an ancient 520STFM, I can say that I was no less than AMAZED when I saw this Aggression megademo on my friend's 1040 STE!! Graphicwise and soundwise, I can't see how this thing could possibly be inferior to the amiga.

P.S. Don't you guys think the average layman is impressed by things like demos? I know they've sold MANY a computer to people I know about. Who really cares about processor speed if the thing kicks ass?

Peace

Jon Armstrong

Er, what's your point exactly? All Amiga chipsets support draggable screens in all modes except A2024 (but that needs a special monitor anyway). Amiga graphics cards still support screens. Some even do dragable ones.

: :-) Funny, indeed. Try cd u:/g:/usr/too[TAB]/pic[TAB] on the WB shell.
: BTW, this is bash under MiNT. And YOUR example doesn't work because the
: Atari hasn't a drive dh2:, just as much as the Amiga hasn't got a drive
: u:.

I could just add: assign u: dh2: and I'll have a U: drive. I could
assign U: G: H: C: D: all to dh2: if I wanted.

And if I felt really silly, I could rename all my files so they were
8.3 long and call all my partitions c: d: e: f:.

Is BASH the standard shell or an add on? I've seen tonnes of kcsh, csh,
bourne, etc shells based on unix shells ported to AmigaDOS. THough, most
people keep the standard shell as is and run their favourite shell
themselves, so applications that have shell scripts for install can
still work.

Hey, does anybody have that .zip file on the Jaguar? It had about
3 screen shots, and a doc about the comparisions about it and the 3D0. I
need it because I deleted my copy of it and someone wants to take a look
at it on amiga.advocacy!
I really need it to back up my statements about why the Jag is
better than the other systems!

If you could, it would be great to get it mailed to my if possible!

A friend cound't get some applications to run so I was asked to help work out what to do. The GUI and CLI were close enough to stuff I had seen else where to make guesses about what to do (there wasn't a manual you see) but it still looked and acted like a joke.

Interesting to see Apple have jumped on the Windows bandwagon. They must be getting financially desperate.

They just announced Houdinni - a 486 & VGA card for 040 based Macs that enables them to run Microsoft Windows software. Cost between 300-500USD.

There is no 'standard' shell on the atari range. This necessitates
adopting the unix standard shell for portability. Hence bash/ash/
whatever. I personally prefer tcsh or tclsh.

Simon.

AGUI is solid is not credible.

I still can`t see the point. Just saying it looks bad ....
|>
|> you: Stop talking shit (about my wonderful Amiga, which everyone knows is
|> near as dammit perfect)

My Amiga is NOT wonderful :
1.) I would like to have a DSP (don't flame me, but
it's nice to code a vector game with a DSP)
2.) I would like 8 channels 16 bit (But some Amiga channels, not
Falcon channels, which are only useful for playing a sample
(I need the DSP for other things !!))
3.) I would like 1024 x 1024 24 bit (perhaps next year)
4.) I would like a OS, that supports MUI
5.) and and and .....
|>
|> Yeah, right on. The GUI isn't a joke---you are.

The Atari Jaguar 64-bit video-game started arriving in stores in
NYC and San Francisco today (Nov. 15). Nationwide roll-out of
the game will come in January 1994, after the holiday season.
I believe European roll-out is expected at the same time.

I've noticed a lot of people say, "bleeh! Your interface sucks,
it looks butt-ugly, my favourite box is much nicer!"

Do Atari folks dislike Amiga's gray-black-white-blue 3d look?

I kinda like the look, along with most of Microsoft's applications.
I detest a lot of Windows shareware that seems to want to use
the gaudiest colour schemes and lots of big funky-multi-coloured
buttons, boxes and icons. Every program wants its own special
dialog boxes, with a big green tick in one corner and a big red
cross in the other. I prefer AmigaDOS's yes-no box, minimalist
as it is.

Coloured icons are nice, but I prefer the 3d gray-scale look with
the minimal use of colour. Mostif/X-Windows applications don't
seem that gaudy, which is a Good Thing (tm) in my opinion.

The only thing I really dislike about AmigaDOS is the standard
Topaz font is rather naff. I've replaced that with MagicWb's
non-propotional font.

What do most people prefer and why?

Well, I've set my workbench up to use the standard 8 colours, apart from active windows which aare a sort of light yellow, and which I find looks nicer than the blue. I use Helvetica for my window titles, and a smaller point size helvetica for icons, which seems to look very elegant and neat, and for the system default font I use courier, although I don't really mind topaz (Am I the only person in the world who doesn't hate it? :-) )
I run in a resoloution of 720*534 non interlaced, and occasionally 800*600 interlaced. Workbench runs in 64 colours, using 32 colours for backdrop pictures (mostly dithered JPEG's), and 16 for a marble effect in my windows, although I don't hesitate to switch down to 4 or even 2 colours if I am short of memory.

I'm not an Atari folk, but I will provide my thoughts. (Surprise!)

>I kinda like the look, along with most of Microsoft's applications.

>cross in the other. I prefer AmigaDOS's yes-no box, minimalist
>as it is.

The big ugly buttons and gaudy colors seem to be the result of using Borland C++ to write the application. Apps written with Microsoft's Visual C++ look much nicer, IMHO, and seem to be a bit more consistent. Of course you don't have to use the standard gadgets, colors, etc., but most people seem to.

OS/2 is something of a minimalist GUI, at least in terms of the requesters, which bear a striking resemblance to those on the Amiga. It does have a little bit "fancier" 3D look, more the result of having a larger number of shades of gray than anything else. This, more than anywhere else, is where the Amiga shows its four color heritage.

>Coloured icons are nice, but I prefer the 3d gray-scale look with
>the minimal use of colour. Mostif/X-Windows applications don't
>seem that gaudy, which is a Good Thing (tm) in my opinion.

I like color for some icons, but the Windows-type icons use some of the funkiest colors, perhaps due to the EGA influence. Some of the nicest icons that I have sport a rendered look to them which looks nice, even when color is used. I'm almost ashamed to admit that I also have quite a few icons which originated on the 256 color Macs, which are colorful but usually tasteful.

>The only thing I really dislike about AmigaDOS is the standard
>Topaz font is rather naff. I've replaced that with MagicWb's
>non-propotional font.

Oddly, I prefer the 1.3 Topaz font to that used in 2.x and 3.x, but I've never considered any of the Topaz fonts to be my favorite. My

all-time favorite is probably the Clean font, followed closely by Thin-711. Did anyone else use "setfont clean 8 all" or something similar in 1.3 to get rid of the Topaz font as much as possible?

>What do most people prefer and why?

My all-time favorite for the way that an interface looks has to be the various flavors of the SGI WorkSpace (or whatever it's being called now). NeXT is a close second in this area, followed by Motif, OS/2, Windows, Workbench, Finder, and OpenLook. Note that this is based purely on the appearance of the systems.

The order is somewhat different when the way that an interface feels is considered, with OS/2 coming in first. Workbench comes in second, followed by Motif, NeXT, OpenLook, Windows, and Finder. It should come as no surprise that the multitasking systems do much better in this area.

It's a bit strange really. Most people who post to the Amiga group are PC owners.

Most people who post to the Atari group are Amiga owners.

And the PC owners are sitting pretty, cause they don't have an advocacy group, so no-one can slag them off. Unfair really.

Ian.

A long time ago, when the Amiga and ST first arrive, Byte magazine interviewed someone who helped developed the Mac's GUI.

When asked what he thought about the Amiga's GUI, he stated that he thought it was very ugly. One of the reasons for this is because the window colors were the same as the background color.

I have the exact same opinion. I've seen screen shots of the Amiga where there are lots of opened windows, but it's hard to separate the windows and the background because they were all the same color. There was only the thin window borders to tell them apart.

By contrast, on the ST/Mac/NeXT, the interior of the window is usually lighter than the background which makes the windows more easier to see.

There was only the thin window borders to tell them apart.

It seems you haven't actually used an Amiga. Versions 2.0 upwards
allow you to specify different patterns to put on the root and in
windows; version 3.0 allows you to selevt pictures also. Of course,
this is only for Workbench file windows; applications select their own
colour.

Btw, I though BW Macs had the "feature" you describe too... Long time
since I used a Mac, though (thank God ;).

By contrast, on the ST/Mac/NeXT, the interior of the window is usually
lighter than the background which makes the windows more easier to
see.

More easier?

It _was_ ugly. Blue-white-black-orange isn't aesthetic in a million
years, particularily with those big gaudy 1.3 icons and gadgets. On
the other hand I'm still nostalgically fond if it -- it was ugly
in an endearing sort of way, if you understand what I mean.

One of the reasons for this is because the
>window colors were the same as the background color.

>I have the exact same opinion. I've seen screen shots of the Amiga
>where there are lots of opened windows, but it's hard to separate the

>There was only the thin window borders to tell them apart.

Well, on the Amiga Workbench at least you can order it to put a
different color, or even pattern, in the background of disk and drawer
windows. Alternatively, you can put a pattern or picture in the
Workbench screen background, and then the windows (which come without
any sort of background) will stand out from it.

I see what you mean, though. It's small, but I wouldn't mind seeing
this in 3.1.

>cross in the other. I prefer AmigaDOS's yes-no box, minimalist
>as it is.

GAK. My pet hate. Programmers who use YES/NO dialog boxes should be SHOT!

For example:

```
BAD #1 BAD #2 GOOD
--- --- ----

The file FOO.DOC The file FOO.DOC The file FOO.DOC
has not been saved. has not been saved. has not been saved.
Save now? Quit anyway?
Save Lose it Cancel
YES NO YES NO
```

(Notice how BAD#1 and BAD#2 ask opposite questions)

The problem is that YES/NO dialog boxes force the user to *read* the
message. But by putting the choices on the buttons, rather than
affirmation/negation of the choice described in the dialog text, the
user has instant feedback.

Worst of all is:

```
Are you sure you
want to quit?

YES NO
```

This question should ONLY be asked if there is some danger to the user,
and should be phrased as under GOOD above.

So don't worry, both the YES/NO and the GREEN-TICK/RED-CROSS are pathetic
user interfaces. Having a GREEN-TICK is insulting the user's intelligence:
Do they think we don't understand the word "Yes"? Next it'll be an animated
nodding MPEG of the user... and still be pathetic ui design.

Get up to date, mon. As of 2.0, windows can have entirely different colors
and patterns than Workbench. You can't compare 1.3 Workbench looks to
Mac Desktop looks.

Besides, all you have to do is to go into the Control Panel, and change
the Desktop pattern to all black, and you've got the same ugly problem
you're talking about, where windows and Desktop look the same.

Not true, check out the comp.os.os2.advocacy group sometime. Every bit as
sensitive as Amigoids in some ways. Especially lately with the announced
halt of WordPerfect development for OS/2.

Which, BTW, was surprizingly similar to what happened with the Amiga some
years ago...

>(although not in 256 colours)

Depends really on what monitor you have plugged in - you can set the update frequency yourself to whatever you find comfortable. But I'll have to wait & check for exact figures - I blew up my SVGA monitor whilst pushing the spec. limits a bit to hard.....

Funny, I dont seem to see Jaguar having been released.. What I -DO- see is Atari being very hush-hush and hiding their faces.

Funny, I already see Amiga CD-32 shipping in Europe/N. America for the past month...

Funny, you missed the major advertisments (hmmm, seems commodore hasn't
run a single ad for CD-32?) in the game publications with the picture
of the Jaguar chasing Sonic and Yoshi...

Or the reviews which claim it is EQUAL to 3DO in graphics (hmmm!)
and the sound must be "heard to be believed"....

Of course, you might have missed all of that by reading Commie-only
publications.

:)

CD-32?

Where?

What stores?

:)

>
>Funny, I already see Amiga CD-32 shipping in Europe/N. America for the past
>month...
>

I have seen absolutely no mention of the CD-32 by anyone. The initial
stock of Jags is sold out, with some dealers jacking up the price as
high as $350. Demand is very high for this box..

($350 is ridiculous, but Atari has hype on their side, methinks)

For those who care, we should have ours (a production model) by next
Saturday... our contact told us that there is some kind of strike
in California affecting UPS and that would affect him getting his
shipment before he can even ship to us... since he's getting his
from someone in NY to sell to us... go figure!

At the recent Future Entertainment Show in London, CD32 was there, CD-I was there, 3D0 was there, Sega and Nintendo were there. No Jaguar anywhere. The show guide did talk about it though. There was a comparison of various consoles, and the Jaguar bit was written by the people from one of the Atari mags. They said that despite Atari's hype, and everything they promised, the Jaguar was a disapointment, and the few games it has are, basically, crap.

The Atari Jaguar won't appear in retail outlets until after Thanksgiving.
Due to a lot of net.misunderstanding regarding the difference between
SHIPPING and APPEARING IN RETAIL OUTLETS, many people are jumping the gun.

BTW, I haven't seen the CD-32 ANYWHERE. No advertisements, no displays in
stores. Zippo. At least this is the case in the area where I live.

Asking managers of electronics chains and retail outlets regarding the
Jaguar, at least there is recognition of the product.

But if I ask the same people about the CD-32 they have all said:
"Cd-32?"

it IS released. read the articles. So far atari has followed through almost
to the letter what it was they said they were going to do.. NY and SF first.
and unless you live in those areas, that is why you do not see one. National
goes NEXT year. After that, well... they haven't set any dates for inter-
national as of yet, but I'm sure they will fairly soon. As for the CD-32,
well.. I haven't seen one yet either, so I guess that makes us even..

Yeah .. I went to the local videogames store .. sure they had a Cd32 .. at 4000 SEK (The Jag will be around 2500 SEK btw), they had NO good games (there are only 10 Meg A1200 conversions available) and they earned NOTHING selling them .. (IF they will sell one - they haven't YET!)

Subject: The AMAZING David Tiberio Show

Hi, I'm Peter Sinclair Day. You may remember me from such famous Usenet posts as "Mac II Centris eats the Falcon any old day" and "I have no sex life, but I do have a mouse!" and I would like to welcome you

D A V I D T I B E R I O ' S
R E A L L Y I N C R E D I B L E
D I S C O V E R I E S

with your host, David Tiberio: Amiga programmer, fitness guru and all around great guy!

David: Thanks Peter, but I think it's time to remind the audience that Commodore has sold over 12x as many amigas as any single model of Apple computer!

Peter: Well I'll be a scumsucking Atari luvin' 3DO multi-player! I think you're right!

Audience: Applause and laughter

David: Of course I'm right, I have 50 times your intellect!

Peter: That's great Dave, but don't you think it's time to talk about what you brought to the studio to show us today?

David: You're right, but don't make a habit of it!

Peter: Yes Master, can I go insult Atari owners now?

David: Yes, you do that Peter and I will tell the audience about the amazing new Commodore CD32!

Peter: But they already know about the CD-I from that other show!

David: Not the CD-I you unworthy flatulence of a Guru Meditation, the CD32, the amazing new multimedia machine from Commodore Computers that actually uses LASERS!

Audience: Applause

Peter: Lasers?!? Aren't they dangerous?

David: Of course not, these are special hand-carved lasers which are used to read information from a flat storage device developed by Commodore researchers known as the Compact Disc or CD.

Peter: CD? Does it have a high interest rate?

David: What the &$# are you talking about? Anyway, the new Compact Disk stores high quality computer program data for use with the Amazing New Commodore CD32! The CD32 is the most advanced computer system in the world and is the product of over 5,000 man years of research by Commodore into providing the consumer with the ultimate entertainment experience!

Audience: Applause

Peter: But what if all they need is an answering machine for their phone?

David: Well that's the beauty of it! The CD32 has an answering machine built in! It's right here abutted next to the CD drive! Why else do think there's a volume control? And that's not all! If you order a CD32 now, we will throw in Susan Powter's "Stop the Multimedia Madness!" which will show you once and for all that the CD32 is the only true multimedia choice over those other inferior systems such as the CD-I, 3DO, or dare I say it, that Atari Jaguar thing!

Audience: Laughter and boos

Peter: What's the Atari Jaguar? Are they illegally importing endangered species again?

David: It's worse than that! Atari, that loser video game company run by those nasty old ex-commodore moles are trying to scam the public once again by taking old Atari 2600s and placing them into plastic bedpans, spray painting the word Jaguar on the whole thing, and then putting the whole mess into a black box that I know for a fact was designed with migrant labor and trying to pass it off as a multimedia

entertainment machine for the 90s!

Audience: Boos

Peter: Wow, there ought to be a law against bedpans!

David: I know, but we can only change the world one home entertainment market at a time.

Peter: Is the 3DO really 3D?

Audience: Laughter

David: No, it isn't at all! That's yet another marketing lie but that one was started by Trip Hawkins, who also worships the devil! Is it any coincidence that if you take the 7th letter of his last name, the 2nd letter of his last name, the 1st letter of his first name, the the 3rd letter of his first name, and the 6th letter of his last name you get something awfully close to a very bad person?!?

Peter: Oh my God! What are we going to do?

David: Fear not Peter! The secret is out now but I have a warning for anyone out there interested in a 3DO! The 3DO can render 64 million pixels per second. However, it has just been revealed that only 16 million of them are under programmer control. 3DO flunkies claim this is for some high tech trick called interpolated anti-aliasing, but I have discovered the horrifying truth! The 3DO actually uses those 48 million pixels to transmit subliminal messages encouraging you to kill your family and start fires in the mountains of Los Angeles!

Audience: Gasps of shock

Peter: Have they no decency?

Audience: Loud boos

David: No, I'm afraid they don't. But luckily, the new 3DO emulator for the CD32 incorporates a special wavefront filter which removes those harmful subliminal messages from all 3DO software. So if you buy a CD32 you will also be able to safely play 3DO software unlike on other machines!

Audience: Applause

Peter: Hooray for CD32! Hooray for Commodore! But I have another question, are they really 32 CDs in every CD32?

Audience: Applause

David: No Peter, there aren't but it will certainly seem like that every time you play one of the 100,000,000 titles available for the CD32. You see, my research has indicated that the Jaguar and 3DO can at best manage 0.0001% of the support that the CD32 can! Since there are 400 3DO developers and 100 projects in the works for it, this means that there are 400,000,000 CD32 developers out there working on over 100,000,000 titles. Now Peter,

get this, if you were to play each CD32 application for exactly one minute, it would take you almost twenty years to try every exciting, vibrant, full color CD32 application!

Audience: Applause

Peter: Wow! But how will I find time to flame Atari users?

David: Don't worry Peter, with the new CD32, you will be so happy with all of its exciting software that you won't want to flame Atari users!

Peter: Get the F*&! out of here?!?

Audience: Laughter

David: It's true, a charter study by the National Institutes of Health has indicated that regularly daily use of the CD32 raises endorphin levels and prolongs sexual endurance! Finally, declassified deep black research was used to design the powerful CD32 controller which can actually relieve rather than cause carpal tunnel syndrome!

Audience: Applause

Peter: Wow, I MUST buy one of these! How do I do it?

David: Well, the CD32 is not officially available yet in America, but through this special Usenet offer you can get the CD32, Susan Powter's "Stop the Multimedia Madness!", and if you're one of the first 300,000 callers, we'll also include the specil CD32 tooth polishing system. Made of a space age polymer, the CD32 tooth polishing system uses a special enamel enabler to make your teeth their whitest, their brightest! You'll be amazed!

Peter: Wow, can I use my credit card to order the CD32?

David: Yes yes, credit card numbers are fine!

Peter: Golly, I am going to go order mine now. You should too!

David: Well that's all for today folks, remember the new CD32 from Commodore: It may be your only hope against eternal damnation!

Audience: Applause

(The preceding claims do not necessarily reflect the view of any sane human being nor should their presentation be construed as advocacy of the preceding viewpoints. This has been a Paid Advertisement Production)

Remember, the CD32 is the only multimedia machine with a volume control built right in! No more fumbling for that pesky remote!

Hahahah, I had to adress this... This was just plain TOO funny... HALF A
MILLION sold already?! BAHAHAHAHAAAAA... I just read a press report from an
interview with Sam Tramiel, president of Atari, and he claims the company is
hopeful to get 500,000 out the door by the END of NEXT YEAR.

I myself would be suprised if they had even MANUFACTURED 1/20th of that figure
by now..

On the other hand, CD^32 in Europe, is selling as fast as Commodore-Amiga can
make them..theyve got a plant in the Phillipines cranking out 22,000 units per
week, and theyve been going full steam since July. You do the math.

CD32 wont technically be announced in America until CES in January. Theyre already being sold in Canada, and by all indications, rather quickly.

Pick up any gamer magazine tyhat talks about the next-generation machines, and youll hear talk about CD32, Jag, and 3D0... But everyone already knows 3D0 will be going down the tubes. Theyve already declared a 7 million dollar loss for this quarter.. Thats two quarters in a row where theyve lost big.. Investors will get a clue pretty soon, and pull out.

CDONLEY, the quote of "half a million sold" was from a C=
fan talking about the CD-32, not the Jaguar. Also, what is
so funny about Atari only releasing 24 titles next year? After
all, they already have over 30 other developers that will be
working on games for the Jag. Of course it is easy to have
more games ready for the CD-32 since they're just 1200 games.
Kind of sounds like the CDTV, doesn't it? Gee, I hope it
sells as well!

They run ads in Europe and Australia. The Australian ads is a bit
cheesy, with some 40-something pretending to be a little kid, and
his father, the grand-father figure babbling away.

: Or the reviews which claim it is EQUAL to 3DO in graphics (hmmm!)
: and the sound must be "heard to be believed"....

: Of course, you might have missed all of that by reading Commie-only
: publications.

Is EGM commie-only?

: CD-32?

: Where?

: What stores?

In lots of stores across Europe, Australia and New Zealand. It's less
vapouress than the Jaguar, which seems to be rolling out in limited
numbers in late November, early December according to the rumours in
rec.games.video.misc.

: >Funny, I already see Amiga CD-32 shipping in Europe/N. America for the past
: >month...

: I have seen absolutely no mention of the CD-32 by anyone. The initial
: stock of Jags is sold out, with some dealers jacking up the price as
: high as $350. Demand is very high for this box..

Sorry, but you tend to choose what you want to hear. What do you
expect, some rabid-Amiga user to cross post his CD^32 experiences
and rumours on every newsgroup known to man?

: ($350 is ridiculous, but Atari has hype on their side, methinks)

Atari has low volume productin run. It's easy to sell out when you
make small volumes. The Amiga 4000 has been on back-order in most
of Europe and Australia due to Commodore placing more emphasis on
the production of the CD^32 units.

Listen: Any new company, no matter what the field - 32-bit games consoles to toilet rolls - will make a loss until it has sold enough product to cover the R&D costs. Established companies may not show a loss during new product development because they should still be selling their older products, but any new company has no existing products to rely on.

If a company wants to design a killer product to annihilate the competition they are going to have to spend a small fortune in R&D and reckon to make a loss for maybe the first 1-2 years. Fortunately there are still some people prepared to take a long term view who realise that, just because a company doesn't immediately start raking in the profits, it doesn't mean they won't do later. In fact, I would be suspicious of any firm that launched an apparently dazzling new product with a huge advertising campaign and yet maintained their usual profit levels, and would wonder what was underneath the surface gloss.

I am no economist, but the above seems like common sense.

Once again, I find myself addressing this issue:

The CD32 is based on a system that has been around for years... No wonder
that it's going to be easy for developers to make/convert games for this
system. The Jaguar is NEW.

>You guys are quite sad. Considering all it takes to develop for CD32 is for
>previous Amiga developers to port their software over to CD format, your
>machine will absolutely be BURIED by the competition if all your company hopes
>to offer is a measly 20 or 30 measly games.

And I suppose you would prefer the 8 bit NES over a 32 or 64 bit system
just because its old software base is the largest of any video game
player. By your logic, you would say that if Nintendo slapped a new name
on this old system, and marketed it heavily, it would crush all the
16, 32, and 64 bit competition just because it has a large software base.
Gimme a break. Look back at when Sega first released its systems.
It didn't have a huge pre existing software base. And it was up against
Nintendo, which was pulling all the strings back then. And now look
at the huge success Sega is enjoying. Last I knew, it was outselling
Nintendo. You seem to be trying to knock new systems that aren't
adaptations of older technology. Why are you standing in the way of
progress? You might as well count the 3D0 as dead also, because it
doesn't have the software library of the CD32, which, I might add,
doesn't have as high a recognition factor as the Jaguar or 3D0. Face
the facts. When comparing the CD32 to the Jaguar or 3D0, it comes in
last place in terms of recognition factor. CD32 may have 1,000,000
titles, but if noone knows about it, it's not going to sell.

True, I agree. However, ask anyone from the 12-year old on the street to the
industry big-wigs, and theyll tell you that 3DO is a flop. No one is going to
buy that hardware at that price, and by the time its price comes DOWN enough so
that it can even be considered, the developers will have long since high-tailed
it out to develop for the platforms that WILL succeed.

As a result, youll be stuck with a $700 CD player that can play Stickybear and Fun With Numbers.

It would be different if 3D0 was gettinf rave reviews. It isnt. Theres a difference between recovering initial losses, and having the ABILITY to recover from intitial losses.

Remember the big stink about CD-I a year ago? Didnt exactly take the market by storm, now, did it? Regardless of how much corporate backing it had. To the point now, where I can count the number of CD-I developers on one hand.

EGM (Electronic Gaming Monthly) is an almost exclusively Nintendo/Sega game-players magazine.

EGM listed the Amiga CD32 as taking second place among the best products to roll out this year... 3DO took something like 7th place, and took honors for "The Worst Products" ...

The Jag came in well behind the CD32.

Part of the problem here seems to be one of perspective, UK vs. US.

C.P. Brown: Trust me, although the CD-32 has been mentioned a few times in the press, so far it has a very low profile over here in the US. Of course, Commodore supposedly will not make any real push for it in the US until the Winter CES (in January '94).

Atari, OTOH, seems to be concentrating the intial Jag effort in the US. In fact, I am unsure whether the postings I have seen of London as a test market site fall under "fact" or "rumor".

Certainly I have seen no word, even from pro-Amiga sources, of definite agreements to market CD-32 through mass merchandisers. Yet, there has been confirmation of the same not just from Atari or rumor, but from managers at mass market outlets in the US, that they will be carrying the Jag once it goes into nationwide release.

Correct. The 72Hz one doesnt work on my 1942 monitor, so I upped the scan rate a
little to get it working. It looks really good, and any interlace flicker is
hardly noticable.

---

But who wants to play old Amiga titles, when the new systems offer so much more!! The only reason I want to buy a console is to get games better than a computer can offer, which the CD-32 can't do, and the Jag and 3DO can.

---
You guys are quite sad. Considering all it takes to develop for CD32 is for previous Amiga developers to port their software over to CD format, your machine will absolutely be BURIED by the competition if all your company hopes to offer is a measly 20 or 30 measly games.
---

I think there will be more than that, as more developers sign on. I also think they underestimate demand for the Jaguar.

One reason there won't be quite so many games is that they will all be new exiting games, unlike old worn out titles that the CD-32 offers. Since all anyone has to do is put an A1200 game on CD to increase the number of titles availiable, of course there will be more titles for it...

One thing I still don't understand - why is Com. stock still hovering around $4 with virtually no activity if they really have sold as many units as you claim?

# 2814. Falcon Owners Group/ATARI UNITED!

Newsgroup: comp.sys.atari.advocacy
Date: 1993-11-21 05:15:17 UTC
From: ABARBIERO@delphi.com
Message-ID: <931121.00917.ABARBIERO@delphi.com>
Source record: 20449

ATARI UNITED! PRESS RELEASE

For immediate release:

Mountain View, CA--November 21, 1993--As part of its ongoing effort to unite Atari owners with support groups and developers, ATARI UNITED! wishes to announce to North American Atari owners the existence of the Falcon Owners Group. The Falcon Owners Group was originally established in March of 1993 and is based in the United Kingdom. The Falcon Owners Group (FOG) provides support for Falcon owners through several services and discount prices for the Falcon specific shareware library which is handled by a professional outfit and accepts international and credit card orders. The Falcon Owners Group Magazine is produced four times a year and distributed with a high density cover disk. This mini-magazine is a legal page sized compilation of useful information concerning hardware and software for the Atari Falcon030. In the 27-page September issue, reviews of Ishar 2 and new Falcon shareware shared space with some extensive Q&A and an ST software compatibility chart. There are a few noticeable typos in the magazine, and little in the way of graphics, but it is rather well laid out for such a new publication. They also provide two BBS for members in the UK (Tel 0454 317047 or 0454 881095) providing Atari message bases and Falcon030 software downloads. While some of the information presented in the magazine may not be new to those who spend their free time online, FOG exists as an effective repository of Falcon specific information and is nearly a complete stand alone source for a Falcon user. Richard Davey, the Club Chairman, is actively seeking the establishment of a North American branch to the FOG, and anyone interested in founding a US or Canadian site is strongly encouraged to contact FOG and request the information needed to spread Falcon030 support to and from the UK.

The only unfortunate side to all this is that they do not have an Internet address yet and while the Membership is only 16.99 pounds for Europe, people in North America will have to pay 20.00 pounds. They accept Visa and Mastercard, or checks made payable to the 'Falcon Owners Group' and sent to:

FOG

I might be being picky here, but citing a salesman ?
Salespeople are *not* normally reliable sources of information.
Nor are they particularly unbiased.

In effect, what you said was "I just talked to this person who
couldn't get a real job and he agreed with me!!!!!"

I'm not impressed.

Bill Grosso

Gee what's almost NO TITLES? Isn't that an oxymoron(sp?). There are about 5 titles (I think). Let's not also forget that the CD32 can also use CDTV disks, about 85%-90% will work. I don't know if I'd trust a salesman to provide me with very accurate info. If you want to base all your answers to things you hear from salespeople then that's your choice. I usually base mine on what I can learn for myself.

:#The CD32 is CRAP, costs TOO MUCH and it has NO GAMES! (All the games available
:#are A1200 games not using the CD storage! LAME!)

Hmmm.. CD32 is crap. Why? Are you basing this on what a salesperson told you?

Costs too much? I don't know, comparing CD32 with 3DO, the CD32 is cheaper. Comparing CD32 with Jaguar w/ a CD-ROM player, it seems almost the same, though the price of the Jaguar itself has been higher than what the initial price was supposed to be. I'd also guess the CD-ROM player will also be higher than the initial price is supposed to be. So far, the CD32 has been selling for less than the initial price. Oh well, people can make up their own minds as to what price they want to pay.

No games? Hmmm, I guess the two games it came out with are imaginary.

Waitaminute. You said there are no games then you say the games are available are only A1200 games...make up your mind, listening to too many salespeople. I don't see what is so wrong with them being only A1200 games...considering that the CD32 is basically an A1200 with CD-ROM. You can even plug in a keyboard and mouse to the CD32 to get it working as a computer instead of a games console. A person by the name of Fred Fish has done this as an experiment.

The CD32 has an added advantage for developers. Since it is basically an A1200, many programs and games will probably be ported to CD, with more screens and sound included to use up the space on the CD of course. Then of course there are already development tools that exist for the A1200, which is easily used for CD32 development.

There is also the added fact that when, I wonder if I should say if, C= does come out with the expansion card for the A1200/A4000 for the CD then there will be all those Amiga owners of the A1200/A4000 that will be able to run CD32 titles, which means more users to buy CD32 titles.

I'm still waiting to see whether the Jaguar will live up to its hype or not before I make any claims on the Jaguar. The CD32 is available, though very, very limited in the North American continent, while prevalent throughout Europe. The numbers on the CD32 seem to say that it is doing very well, no matter what all the naysayers seem to want to believe. 3DO, is here and the numbers don't look so good as yet.

I don't care what the features are right now from either of these three consoles since the marketplace has shown it doesn't matter what the features are. The only thing that decides whether a product survives is availability, number of users, and cost.

I'll probably wait until mid next year before I decide on which console I'll purchase to replace the Genesis I bought for my nephews a couple of years back. By then, we'll probably see the dust settle a little bit and things become more clear.

If it won't be in America until January, then of what relevance is it to
American consumers to hear how well the cd^32 is doing (allegedly, i might
add, as i have yet to see any sources for info on this) when it appears
that over here, from the trade rags to the consumer rags, the Jaguar
appears to be poised to be the only competition for the SNES and
Genesis in the sub-$300 range?

And has anyone considered that the CD^32 may suffer from the same problem
the Amiga has in America? Atari has proven they will market the Jaguar in
America, but I see no indications that Commodore is going to market the
CD^32 here.

No, who's impressed with the CD32 ... 16 bit technology ..

They HAVE the games currently available for the CD32 .. NONE of them uses more than 10 Meg storage, and they ALL are A1200 conversions .. WOW ... "new technology" .. sure .. gimme a REAL 32bit or rather a 64bit system any day!

# 2823. CD-32 and Jaguar Nonsense

Newsgroup: comp.sys.atari.advocacy
Date: 1993-11-21 20:38:46 UTC
From: ricardo@rchland.vnet.ibm.com
Message-ID: <1993Nov21.203846.42233@rchland.ibm.com>
Source record: 20457

Well, guys, I love the Amiga and all that but those that bash
the Jaguar: can we wait to actually take a look at it and even
play it a little bit?

I mean, so far it looks like the Jaguar can do things that the CD-32
just can't. Of course, the CD-32 has a double-speed CD-ROM which is
good indeed, but it still doesn't mean the Jaguar is bad either.

For the US market it is definitively true that C= hasn't shown
anything yet (they will officially anounce it in January) and is good
that magazines like Computing Gaming World liked it quite a bit. Atari
has already started limited marketing in the US.

Over Europe, is the other way around, and the CD-32 has already been
selling quite well.

Time will tell, and the Jaguar needs more support- but it is starting
to get it- Virgin Games, Interplay, Microprose and Accolade announced
support for it.

Let's wait and see. I love my Amiga, but I don't consider myself
blind. The Jaguar looks good and ATARI for the very first time in
ages seems to have been doing (so far) an excellent job. Let's wait
and see...

---

PS: I agree that it defintively looks like ATARI has hyped the Jaguar
quite a bit (and some people around here). But looks like even
taking out the hype, the Jaguar has what it takes.

The CD-32 could do awesome role-playing games, let's see what
they do with it.

>
>WHERE!!!!!!!

What are you, a fucking idiot? Have you seen any Amiga eurodemos in the past 5 YEARS?! the Amiga has ALWAYS been able to do REALTIME scaling AND rotation of graphic images. Hell, even a Genesis can zoom/scale/stretch its graphics. Guess what? Most if not ALL games development for the Genesis is done on the Amiga, because the hardware beneath both is so similar.

The Amiga community has already HAD "specialized" graphics chips, and has had them for YEARS.

>
>JC> Costs too much? I don't know, comparing CD32 with 3DO, the CD32 is

>the Jaguar's expansion port??)

Wrong. See, thats called "vaporware". There DOSENT EXIST a keyboard, mouse, CD rom, and whatnot expansion for the Jaguar. These things, and more (modem, external 3.5" drive, MPEG module) are ALREADY available for CD32.

What's wrong woth you? I don't see Jag as a threat to CD32... Why can't
both systems co-exist peacefully? every jag sold == so much less money
for those japanese firms that have turned the majority of the
younger generation into mindless zombies with Mario-caps etc...

Wow, this is great. I never saw a 320x200 4 bitplane picture rotated on an
Amiga. What chip is doing the calculations? Can this chip also do a Mode7
projection to get a 3D landscape effect?

Thanks for the info.

Dude, keep up with the news. The Jaguar was rolled out, should
start appearing the New York and L.A. in around a week, and will roll
out nationally (and internationally?) in the beginning of next year.
This has been known for awhile...

Even saw a Jaguar commercial on TV on Saturday :-O

a) Those 'many titles' are also available on disk, well, most of them are.
b) The CD^32 is by no means a NEW product, it's just a repackaged A1200
(Atari tried this with the XEGS and failed).
c) For a video game, ROMs are usually better than CDs, because they
are faster (in fact, I like the NEO*GEO of a friend more than the CD^32),
even though the CD^32 is cheaper.

And I am still wondering: WHY should anyone who is already owner of an Amiga
buy a CD^32? Remember that C= themselves asked the games companies to make
their CD games compatible with ALL AGA machines (including the 4000/040).

And for all the other ones: there is SEGA, and there is NINTENDO, and even
here in Germany I haven't seen the CD^32 in any shop yet (including
Galaxy, Munich, where they even have the 3DO and the NEO*GEO, and
hopefully the Jaguar next thursday, imported directly from the U.S.).

I agree. There are a lot of people bashing these systems, and they haven't
even had a good look at them yet. Still, I think it's interesting to
see some of these arguments. ;)

>PS: I agree that it defintively looks like ATARI has hyped the Jaguar
> quite a bit (and some people around here). But looks like even
> taking out the hype, the Jaguar has what it takes.

I agree here also. The Jag titles have recieved mixed results, but these
titles are very early releases and we should wait and give developers
time to learn to harness the full potential of the Jag.

## 2840. Atari jaguar

Everyoen has had "specialized graphics chips" but the original poster was
just pointing out that the Amiga doesn't have a custom chips designed to
accelerate some of the more useful graphics functions when you step
beyond blitting and change resolutions on a scanline.

Sure you could use the 680x0 to do that, but let's go back to our old
Falcon vs. A1200 debate... how much do you really want to make the CPU
work do to something? The same people who nitpicked that the Falcon
would need 2% CPU time to play back 16-bit samples in 8 channels are
the same ones now claiming it is no problem if the CD32 has to use
it's CPU to do graphics functions whereas the Jaguar doesn't.

I find this incredibly hypocritical.

The bottom line is quality, and I haven't seen a single game for
the CD-32 with widespread name recognition. The console, in America
at least, does not exist and no one knows about it.

So while it may be a hot topic in Europe, it's dead here.

Not quite sure what you mean.

However, I -have- seen for a FACT, several Eurodemos running on stock,
unaccellerated (68000/7) Amigas with the old ECS chipset, taking graphic images
and rotating/zooming in and out of them in real time..

As it zooms into the graphic image, it rotates, you zoom out, its still
rotating.. Its quite cool.

Now, considering that the old Amigas have like 1/4th the CPU speed and 50% less
bandwidth horsepower as the CD^32's AGA chipset, it would be only true to say
that CD32 could do it better, AND faster.

Yea! lame ports of 16 bit software. What an incentive to buy.

: And hell,
: were even yet another step ahead of you girls, because the CD32 has a CD-ROM
: already on it! We dont have to dish out another $200!

If Atari has learned one thing from SEGA it is to release the hardware when you have software to run on it. And I do not consider ports of 16 bit games to be the software that I expect on this generation of machines.

: You guys are quite sad. Considering all it takes to develop for CD32 is for

Well if these are games that due justice to the hardware in the Jag then the CD32 will die a quick death. I will admit that C= ships well in europe. Part of that may be that in some segments of consumer electronics they are years behind and that a system with a dinky 68020 would impress them.

And where did you get that bit of wisdom? The original posting doesn't
say one way or the other. Back it up or retract it, and I demand that you
show some proof if you're going to claim I'm wrong.

Show me where Atari claims that only 24 titles will be released during all
of 1994 for the Jaguar and I'll shut up.

Otherwise, why not consider getting a life? :)

>
>>>

>

Which is exactly why the CD-32 will fail. Who is going to produce for it?
or is it just goin to rely on ports of games from the A1200 and A4000?

And now for the "idiot" question for all the Cd-32 advocates:

if all the games are being ported from the AGA machines, and those are normally distributed on floppy (I don't remember the A1200 shipping with a Cd-rom, do you?) then why would a company spend the money to add on to a game to really max out all of that added storage on the CD-32 until there are CD-32 units selling in huge quantities?

And if all the games are A1200 ports... why not just buy an A1200 for the same price since the games won't be any different? All that CD-ROM storage means nothing if the game is identical to the 1200 version, and might actually be slower than the 1200 version if the title is hard disk installable.

So come on, Mr. Idiot, and tell me why the 1200 is so much worse than a CD-32 that in a side-by-side comparison, I'd want a CD-32. :)

Yes, right. That in the same way that people in the states tend to be obsessed with PC clowns, whilst over here, systems such as the Amiga and Archimedes do well, because people take time to find things out, and don't believe everything they see on 15 second slots of commercially-overloaded-with-hype TV ads. The idea that the European consumer electronics market is 'technologically behinf' is raather ludicrous. Look at NTSC, for example. Compared to PAL, the picture quality is foul, and AFAIK NTSC doesn't carry a teletext signal, which is a really good feature to be missing out on. Take CD... It was available here before it was available in the US. I think you'll find that people in Europe generally make purchasing decisions based ability rather than hype. That is why the Amiga is the most popular home-computer here, and why Amiga Format sells more copies per month in the UK than any other 'male interest' magazine (excluding the top-shelf variety).

Well, I would rather have 20 or 30 measly games than a million shitty Amiga
games. A plethora of simply awful games can hurt a system much more than
stupid Amigaoids would like to think. I would like quality, not quantity.
There is no guarantee that all the Jag games will be good quality, but what
I have seen of the CD32 is downright garbage. It's an outdated system with
outdated hardware and outdated games. Its only future is in Europe.

Remember, this is our friend Clayton Donley who masturbates to his Amiga,
posting idiotic and uninformed posts about the game machines, gourad shading,
etc. He is so ignorant that he actually gives us an even _worse_ image of
Amigaoids.

Clayton: Your posts are a waste of bandwidth. Shut up.

Hope you have as many scractches as possible on yer CDs.
h

## 2859. Why the CD32 is better than the Jag..

Newsgroup: comp.sys.atari.advocacy
Date: 1993-11-23 02:13:46 UTC
From: cdonley@amiganet.xnet.com
Message-ID: <cdonley.2oh7@amiganet.xnet.com>
Source record: 20387

500,000 CD^32s have already been sold in Europe.. Commodore has a plant in the Phillipines that has been running 22,000 units per week since mid July, and according to Commodore, theyre still having problems meeting the demand. Do the math, 22,000 units per week since mid July--its now late November. About half a million units.

Your "64 bit multimedia system" (bahaha) is a 64-bit graphics processor, which the CD32 already has the equivalent of with ITS set of SEVERAL specialized high-speed graphics chips, the software (30+ titles already available as opposed to the Jaguar's >>>4<<< titles..) that the Jaguar WISHES it has (and the President of Atari -hopes- he'll have by the end of 1994!) .. We also have a double-speed multisession CDROM in EVERY CD^32 unit, which is still vaporware for the Jag.. Id be impressed if ALL of the Jag were wired at 64-bit, but the sad truth is that the only thing 64-bit about the Jaguar is its graphics chip. The rest of the unit is at 16-bit. Im afraid youve been duped by marketing twits..

If Commodore decided to lie to its markets like Atari needs to, Commodore could get away with calling CD^32 a "64 bit game machine" because certain segments of the graphics hardware have a 64-bit wide direct path to memory. The rest of the console, however, remains 32-bits wide, as opposed to the Jaguar's 16. What makes you think that Atari will sell its Falcon 030... A machine with a 32-bit CPU on a 16-bit bus for over $1000... And turn around and sell a GAME CONSOLE, with what they claim is 4x the bandwidth increase, and better graphics for $250? You have GOT to be kidding. Hello? Hello? Reality check..

Remember the Turbo-Grafx 16? How Nintendo would crow night and day about it being a "16 bit game machine" , when infact, it still has shitty 8-bit sound, and 8-bit graphics..How Nintendo made the graphics chip in the Turbo-Grafx 16 with an extra >>> 2 PIXELS <<< horizontally, JUST so they could say it had HIGHER RESOLUTION than the old 8-bit Nintendo? The only thing "16 bit" about it was the 65816 CPU, which ran at 2.8 Mhz, and was barely a step above the 6502 chip found in a Commodore 64.. Atari is trying to pull off the same thing by calling their Jaguar a "64-bit game machine". Im not disputing the fact that for its price, the Jaguar is a nice system. I DO, however, argue the fact that the Jaguar is a full 64-bit system. Youll see, once the reviews are written, and all the dust has settled... And youll feel like an idiot not only for spending $250 for a console doomed to a quick failue, but because you believed all the hype.

The fact of the matter is, that CD32 offers -right now- what the Jag only HOPES it can someday have...Realtime scaling, and rotation of graphic images, high speed blitter operations, gouraud shading and transparency done in realtime (Just take a look at a couple good Amiga eurodemos, ive seen a stock Amiga 500 with 1/4th the CPU power of a CD32, and even with the OLD graphics

chipset, animate a 120-facet transparent multicolor vector object in realtime, 50 frames per second!) A wide assortment of titles available, a double speed CD rom, full-motion video, the ability to add on a modem, keyboard, and whatever you like...a huge development base of pre-existing high quality Amiga games and software to draw upon, and the official thumbs-up from 3.5 million Amiga users worldwide. All of these things are -ALREADY AVAILABLE- for the CD32.. Not "have been announced" or "in the works" .. AVAILABLE..Weve already hit a home run with the machine, sonny. The Jag already has two strikes against in, in that initial reviews are less-than-good.. Electronic Gaming Monthly, a largely Genesis/SNES gamer-magazine placed CD32 as 2nd place in the Top 10 picks for Best New Hardware of the Year.. Guess where the Jag was? 7th, I believe.. 3DO came in as "The Worst New Hardware".

Pick up this months issue of AmigaWorld, the CD32 is right smack on the front cover. I encourage you to read up on its stats.

>Which is exactly why the CD-32 will fail. Who is going to produce for it?
>or is it just goin to rely on ports of games from the A1200 and A4000?
>

You must be really stupid. Any AGA-chipset machine (INCLUDING the CD32) can play ANY Amiga game ever RELEASED, EVER... Everything from 1987 Battle Chess to 1993 Body Blows ][..And considering its cheaper for game developers to release their software on CDROM than it is for them to release on a cartridge ala Jaguar, which do you think will be more attractive to developers?

>
>And now for the "idiot" question for all the Cd-32 advocates:
>
>if all the games are being ported from the AGA machines, and those are
>normally distributed on floppy (I don't remember the A1200 shipping with

>a game to really max out all of that added storage on the CD-32 until
>there are CD-32 units selling in huge quantities?

Who says they have to use all 550 megs? Duuuuh.. Youll notice that most CD-ROM games only occupy 5-10 megabytes of a 550 megabyte CD.

>
>And if all the games are A1200 ports... why not just buy an A1200 for the
>same price since the games won't be any different? All that CD-ROM
>storage means nothing if the game is identical to the 1200 version,
>and might actually be slower than the 1200 version if the title is
>hard disk installable.
>

Amiga 1200's cost 3 times as much, for a reason. Amiga 1200's are COMPUTERS. Amiga CD^32s are GAME CONSOLES. Get the picture? You must be afully stupid to think that a CD32 game would be slower than an A1200 version.. The CD32 comes with a CD-ROM (You know, the thing Jag owners can only dream of?) that can read off the disc at 300 KB per second..The CD^32 also has 2 megabytes of high-speed 32-bit-wide memory..The Jag is stuck with nice 'n slow 16-bit memory. I dont see your point--Oh, thats right, I forgot... Youre an idiot, therefore you have no point.

Oh, I see.. A console like the CD32, which is capable of displaying 4 TIMES as
many colors at even HIGHER resolutions than the Jaguar is "crappy and outdated"

To say nothing of the fact that a CD32 can animate at that resoltuon, full
screen, in 262,144 colors. Yeah, I see your point. Your point is, youre a
completely clueless moron.

You'll notice most CD^32 games use 5-10 megabytes of a 550 meg CD,
because they are just "ports" (copies) of the same Amiga software
that is available on floppies, except pressed on CDs. Stupid,
if you ask me. Then again, Clayton Donley is familiar with
the concept of stupidity. He's the expert.

>projection to get a 3D landscape effect?
>

Not quite sure what you mean.

However, I -have- seen for a FACT, several Eurodemos running on stock,
unaccellerated (68000/7) Amigas with the old ECS chipset, taking graphic images
and rotating/zooming in and out of them in real time..

As it zooms into the graphic image, it rotates, you zoom out, its still
rotating.. Its quite cool.
-----------------------------
Hmm... a few images, eh?

Imagine yourself in front of a { jag, 3DO - pick one }. You see one
image being scaled and rotated before you.

All of the sudden, the image splits and there are two. Then 20. Then
100. Then over a thousand, and you've lost track of the images. Some
of them are transparent, some show the lights of distant moons shining
on them. Some are being pulled and distorted in ways that are beyond
your comprehension.

Then you look back at the Amiga. The image splits into two, then
four, and... GURU.

---
Now, considering that the old Amigas have like 1/4th the CPU speed and 50% less bandwidth horsepower as the CD^32's AGA chipset, it would be only true to say that CD32 could do it better, AND faster.
---

Ok, it could perhaps rotate/scale 4 bitmaps at once!! Wow I must by one before they are sold out by hordes of eager youngsters clawing themselves to get a machine with sub SNES graphics capabilities.

Thorsten Guenther (guenther@vati.fmi.uni-passau.de) wrote:
:#a) Those 'many titles' are also available on disk, well, most of them are.

I'd say about 1/2 to about 3/4 are available on disk. Though one must
remember that the ports to CD-ROM usually come with more things added.

:#b) The CD^32 is by no means a NEW product, it's just a repackaged A1200
:# (Atari tried this with the XEGS and failed).

Not, a New product true but still the first 32-bit game console..8-).

:#c) For a video game, ROMs are usually better than CDs, because they
:# are faster (in fact, I like the NEO*GEO of a friend more than the CD^32),
:# even though the CD^32 is cheaper.

Catridges are only better in the fact they are faster at access. In everything
else they are worse. A CD-ROM has more storage, the more storage, the more
information that can be stored. CD-ROMs are also cheaper to produce than
catridges, in quantity. Cheaper to produce means cheaper software for
users. Looking at the market you will generally see that CD-ROM games are
cheaper than its catridge based versions, with exceptions. Let's not
forget that with a CD-ROM you can have CD quality sound to accompany your
games. Then there is the capability to use other CD products, such as
music CDs, PhotoCD, movie CDs and CDs formats that other computer platforms
utilize.

I also like Neo-Geo but there is no way I'm going to pay big bucks for
those games. Much less the money that one has to dish out for the console
itself. My pockets aren't that deep for a game console.

:#And I am still wondering: WHY should anyone who is already owner of an Amiga
:#buy a CD^32? Remember that C= themselves asked the games companies to make
:#their CD games compatible with ALL AGA machines (including the 4000/040).

Why not? Not every Amiga owner has an A4000 or A1200. There is still a
large base of Amiga owners that have an A3000T or below. Buying a CD32
will be like getting an A1200. Those that have the A4000 or the A1200 will
most like get the adapter card to run CD32 titles on a CD-ROM player.

:#And for all the other ones: there is SEGA, and there is NINTENDO, and even
:#here in Germany I haven't seen the CD^32 in any shop yet (including
:#Galaxy, Munich, where they even have the 3DO and the NEO*GEO, and
:#hopefully the Jaguar next thursday, imported directly from the U.S.).

Don't know what kind of shops those are in Germany but, here in the U.S.
I've already seen advertisements for CD32 for sale from a mailorder firm in
Canada, and another from a U.S. mailorder firm named Tenex. Just got my

catalog from Tenex this weekend.

There is one thing I still don't quite understand about Atari. Since the major supporters of Atari are in Europe why are they releasing the Jaguar in U.S.? I'd think that Atari would release the Jaguar concurrently or at least first in Europe and then later to the U.S. The name of Atari is still recognized there but in the U.S. it's a little worse off than C=.

Well I won't say much about Donley since most of that is in his opinion but as for a game only taking up only 5-10 MB, well the rest is probably used for sound and whatever. Some games will be ports there is no doubt about that but most if not all these ports will come with extra levels, screens, etc. I forget which game it was, but C= had made a mistake by shipping early CD32s with only the A1200 version on the disk. The later CD32s came out with the correct CD32 version which had CD quality sound that wasn't included in the A1200 version. I don't remember if there were more things other than sound that was missing. By the time the CD32 was ready to ship, the CD32 version wasn't ready as yet from the developers so, C= had the A1200 version shipped.

Another developer had stated their Pinball Illusions or with it Fantasies, whatever, will come out more levels for the CD32 version than the Amiga version.

Come to Stuttgart (in Germany)!
I know a dealer which has tons of CD32s' and only sold ONE in 2 months.
You can imagine that he's getting very bored with this system...
Where do you get those stupid figures (and why do you belive them?).

I have cut off the rest of your post, because ther is no true information
in it. Poor boy.

>Pick up this months issue of AmigaWorld, the CD32 is right smack on the front
>cover. I encourage you to read up on its stats.

The leading games-magazine in Germany ("Power Play") had a CD32-articel with
the following headline: "CD32 Top oder Flop?" (which means: "CD32 on top or
sucks?"). At the end of the article it comes clear: CD32 probably is
a "FLOP" as the CDTV was. Sorry, but that's the truth you should face now.

Ciao, Heiko.

Somebody, plleeaassee give this guy a life. What a poor excuse for a human beeing.

How is it possible to say that CD32 is technical better than the Jaguar?

If it is the amount and not the quality of the software that is the question, so let us all go and buy a C64 or a NES ..........

You all know that future (and the first) titles for the Jaguar will crush the CD32 !!!

That's exactly what I mean.
How many colors did that picture have? One? I wonder how you could rotate a 4
plane picture.
>
> As it zooms into the graphic image, it rotates, you zoom out, its still
> rotating.. Its quite cool.
I would like to see that demo. Where can I get it?
Remember that demo-writing the the art of cheating a lot. Most demo-routines
are completely unusable for games. That's why demos always look far better
(technically speaking) than games.

> Now, considering that the old Amigas have like 1/4th the CPU speed and 50% less
> bandwidth horsepower as the CD^32's AGA chipset, it would be only true to say
> that CD32 could do it better, AND faster.
With that you get ONE picture rotating. With SNES you get ONE picture rotating
AND projected in 3D (well u can do more...). With 3DO/Jaguar you get loads of
pictures rotated and 3D-projected.

Advantage of the cd32: you can have a series of pictures directly read in from
the CD. But is there a CinePak/Mpeg decoder build in in ~standard~ ?

And what exactly are these segments of consumer electronics that are years
behind? In fact I could argue the opposite that we are years ahead in some
areas.

For example do you had near CD quality digital stereo sound transmissions
with your terestial TV broadcasts? We've had it here in the UK for the
last 4-5 years. High resolution with no co-channel interference unlike some
inferior archaic analogue AM stereo sound systems I could mention :)

I guess we've become acustomed to getting the best so the CD32 should do
well.

Here we go again, Mr. Idiot gets all wrong again :-)

> Your "64 bit multimedia system" (bahaha) is a 64-bit graphics processor, which
> the CD32 already has the equivalent of with ITS set of SEVERAL specialized
The CD32 has to blit through a narrow 32 bit bus, whereas the Jaguar can blit
throug a 64 bit bus. That makes twice the speed.

> for the Jag.. Id be impressed if ALL of the Jag were wired at 64-bit, but the
> sad truth is that the only thing 64-bit about the Jaguar is its graphics chip.
Well, the SNES is 16 bit. Why??? Because of it's 8 bit CPU? No, because of
it's 16 bit grafix DSP. We are here in the games-console market, were evrything
is mesured in the highest available bits.

> The rest of the unit is at 16-bit. Im afraid youve been duped by marketing
> twits..
Ah, fine, the 68000 is the rest of the unit :-)

> console, however, remains 32-bits wide, as opposed to the Jaguar's 16. What
> makes you think that Atari will sell its Falcon 030... A machine with a 32-bit

This is only the normal demo-cheating !!! I did it too. I worked out a dual

playfield with digisound and overscan and fullscreen distortions and scrolling
in 16 colors on a stock ST with only a 8Mhz68000 and NO blitter, NO digisound
hardware, NO hardscrolling/distorting and NO overscan register!
WOW that's a powerful computer! Where is the ST now???

> rom, full-motion video, the ability to add on a modem, keyboard, and whatever

That makes clearly out that that mag is bullshit. 3DO should have come out
as best (or second best) hardware.

Look at the software that comes with the CD-32. In particular, Diggers. This is a CD-32 title that was later ported to the A1200, and the AZ1200 version is a cut down version using less storage space. Also, why should all games use 600+ Megabytes? I don't partiucually want the situation that exists on the PC, where games such as wing commander take up huge amounts of harddisk space with lots of pretty graphics, and then have very little gameplay. How would you make classics such as Tetris fill a 600MB CD, because IMO Tetris is a much better game than Wing Commander. Look at the recently released Frontier. The executable is 600K long, and this is probably going to go down in history as one of the best games of all time (like it's predecessor, Elite, which incedentally ran on a 32K 6502 based system). The nice thing about having a CD storage medium is that you can have long CD quality soundtracks, as well as lots of really nice graphics, whitout sacrificing gameplay. (If you havent seen a CD-32 animate directly from CD, I'd advise you to go and haave a look, because even without the MPEG module, it's amazing. With the MPEG module, you get full 25fps PAL video, which is superior in quality to VHS by a long way, and also includes CD sound. This is another nice thing about the CD-32. Not only is it a great games console, and can easilly be expanded to a full computer (Microbotics already have an expansion providing up to 8 MEGS of 32 BIT FastRAM, as well as interfaces for floppies, etc), but it also makes a superb audio, video and MPEG CD player, and IMO is worth having just for that.

But...the Jag's not even out yet! You'd damn well BETTER have more games!
And are they NEW games, or existing games pressed onto a CD?

More idiocy..The CD32 has a planar-to-chunky pixel mode convertor in the
hardware, so such things would be even EASIER to do.

Hahahah, the Jag's memory is addressed 64 bits at a time? bRrrWhoHEHAHAHA!!! Yeah right, youve got 64-bit-wide memory on the "Gaguar" now? Yeah, RIGHT. Too bad the cost of that much 64-bit memory goes for like TWICE as much money as the entire Jaguar goes for.

The Jag's memory is 16-bit. Sorry to burst your bubble, percy, but thats just how it is. Why? In order for the 68000 to access it, it must have a 16-bit path. A 68000 cannot address 32-bit memory, period.

So what's the big advantage of CD then? The fact that it is slower than
the cartridge makes it better? :) Oh, it's cheaper to produce, huh? Is
it just me, or has anyone else noticed that CD games for 3DO and Sega cost
as much as cartridge games? Heck, CD costs less to produce than audio
cassette, but guess what... go to your local music store, and CD costs
a few dollars more.

Duh! :)

"It's not what is cheaper to make, but what price the market will bear!"

So what you're saying is that... it's ok that CD-32 games don't use all
that vast CD-32 storage because... well... it's cheaper than cart, but
are any of the games below the $40-$50 price point set for Jaguar carts?
And what is on the CD versions that isn't in the A1200 version on floppy?

>>

Amiga 1200 sells in this country for $350-$380.
You say "Amigas 1200s cost 3x as much for a reason"...
Well, that means the CD-32 is selling for $100, right? Or did your mother
wean you a bit too soon?

The bottom line is... you don't have any facts to back up your argument.
The CD-32 is playing games that were designed to be run off floppies and
won't utilize the CD-ROM drive to its fullest (and in fact, the games
will require that you wait and wait and wait during those fast 300k
load times (gee, i guess that compares favorably to an A1200 IDE drive
for you to like it so much, huh? :) ).

So in my neck of the woods, let me lay the word upon you:

Amiga 1200 w/2MB no HD is $380.
The MSRP on CD-32 is over $325 last I heard.

So, moron, did you take "new math"... and come up with 3 x 325 < 380? :)

>+-------------------------------------------------------------------------+
>|Amiga 2500/030/882 @ 33 Mhz!| // "I trust Irving Gould about as far as I |
^
|------ got a math coprocessor and can't multiply! :)

Your an asshole, and you're wrong. The Jaguar can display 16.7 mil. out of
16.7 mil, (in other words, as many colors as the resolution provides pixels.)

The Jaguar has a 64-bit data bus. The Tom chip, which includes a 64-bit
RISC processor, among other things, has 64-bit access to memory.

>The CD32 can display >262144< colors AND animate at that resolution, from a

>that but most if not all these ports will come with extra levels, screens,
>etc. I forget which game it was, but C= had made a mistake by shipping
[ stuff deleted ]

Well, here's my point:

Donley claims the Jag is not as good as CD-32 because it lacks a CD-ROM.
Never mind that you can add one later, and still come close to CD-32's
price, with the prospect of even better performance....

Now, let's say Donley is right, and the CD-ROM is "all that"... well,
what good is that device if the games being ported are all able to
fit on a cartridge anyways? I've seen 3DO games, and in the case of
the title that comes with it (Crash 'N Burn), I know Sega or SNES would
be hard pressed to put something like that on a cart. The Jaguar's
carts are higher capacity, and could do it (or at worse, come very close!)
and have no "load time" involved.

So I'm wondering... what good is this advantage until software comes
out that demands the added storage?

Price isn't a factor... the games cost as much as cart titles.
Speed is slower than a cart.
Storage... well... if it's not being used, it's a waste.

I'm not saying CD-32 is a bad system, only that it's ridiculous for
anyone to claim it can stomp on the Jaguar.

(in fact, i really don't think it will be able to compete with Jag
in the marketplace because of the keywords "64-bit" and the 24-bit
video...)

>
>Another developer had stated their Pinball Illusions or with it Fantasies,
>whatever, will come out more levels for the CD32 version than the Amiga
>version.

>

Not to be too inflammatory, but if only one title shows marked improvement
over the A1200 version, what is the purpose of CD-32?

Because if I am paying $200 extra for a CD-ROM system, it should give me
something more than what can fit on a cartridge.

:)

I don't think any game that uses 600MB is going to be made anytime soon,
making CD nice as a medium for growth... but... reality also states that
people's expectations for a CD game are going to be higher. If the Jag's
cart games are as good as or better than CD-32's CD-ROM games... what
do you think a consumer is going to think of CD-32?

>down version using less storage space. Also, why should all games use 600+

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Living in the United States of America, I won't be able to do that until
next year. :)
As for CD sound... well... that's fine if you don't mind having the song play
over and over and knowing it won't be able to play while the game LOADS,
for example.

Is this turning into a British vs. America taste war? I mean, geez, if you want to get down to it, both Atari and Commodore are U.S. companies who can't compete against the big boys here, and so they try to whip up a frenzy over seas. Period.

I don't think the Europeans are any different in their buying practices because they still buy those PC clones, and still buy SNES and Genesis.

Jaguar is 720x480 with 24 bit video. So tell me, is the CD-32 doing 1024x768
with 96-bit video? :) How are you gonna pull that off on an NTSC TV? :)

And what the heck is 96-bit video?

Please remove your hand from your underwear slowly before you answer.

El-wrongo, my idiot companion.

Jag does complete, true, 24-bit video. That's about 16-bits more than the
A1200. And that's even with the HAM8 stunt.

:)

Payback sure is a bitch, ain't it?

:)

The chunky converte does not compensate for the missing grafix power. Look at
the PC's. Suppose the CD32 has the power of a 486-66 with localbus grafixcard.
Now look at the texturmapping games on PC. Are they nice? Yes.
Are they fluid... ermm well. Do the have many polygons at once? No.
On 3DO/Jaguar, this answer is always YES. See the difference?

Hello!!! Here we go once again, Mr. Idiot got even more wrong:

> Hahahah, the Jag's memory is addressed 64 bits at a time? bRrrWhoHEHAHAHA!!!
> Yeah right, youve got 64-bit-wide memory on the "Gaguar" now? Yeah, RIGHT. Too
> bad the cost of that much 64-bit memory goes for like TWICE as much money as
> the entire Jaguar goes for.
Oh wow, here we have a specimen of a race who does not knwo what a 64bit
organized memory looks like. It's like a car.
Normal people, when they want to drive with 8 tyres side by side on a road they
would take 4 cars and put them side by side on the road.
Mr. Idiot doesn't do it like that. He will do an buy a 8 wheel per axis car
and drive with that on the road. Oh my god, how silly!!!

> The Jag's memory is 16-bit. Sorry to burst your bubble, percy, but thats just
> how it is. Why? In order for the 68000 to access it, it must have a 16-bit
> path. A 68000 cannot address 32-bit memory, period.
Imagine that it might be possible that Atari had the really improbable
occurance of an idea which could solve this problem. And so it happens that
when the 68000 accesses RAM this request goes through the ram controller which
is in the non existent 64 bit chip and is converted to a normal 16bit acces
to the RAM. Well in fact it's a 64 bit access where u use one of the 4 words
to send it to the 68000. Which word is taken is decided with the 3 lower
adress bits of the 68000's requested adress.
Don't start to talk about bus contention!!! There is a lot of bus contention in
the Jaguar. That's why the bus is so fast, so that it keeps going even when
everyone is accessing the RAM intensively.
This is so evident I did think that everybody knows that.

Yes, I did basic math... and here's the facts:

The Jaguar uses 24 bits for each pixel.
The Amiga 1200 and CD-32 use 8 bits (maximum) per pixel.

24 - 8 = 16.

Now, if they pull tricks to "simulate" having more bitplanes, that's nice,
but the number of bits per pixel is the same.

So please, butt out unless you're going to demonstrate that the AGA chipset
is using more than 8 bits to represent one pixel.

## 2909. HAM8 is the MiniDisc of the video realm

Newsgroup: comp.sys.atari.advocacy
Date: 1993-11-23 17:34:22 UTC
From: cmedley@wam.umd.edu
Message-ID: <2cthiu$ek2@cville-srv.wam.umd.edu>
Source record: 20338

All this talk of HAM8 is interesting... here's my personal opinion, and I am curious to see what the Amiga users think of this...

When doing professional audio, most musicians don't use MiniDisc or DCC because they use lossy compression schemes. Never mind that few people can hear the difference, because when you overdub or attempt to do some kind of multitracking with 2 of them, you will get loss.

Now imagine this:

A user has a beautiful HAM8 image. If that user touches it up, or say, adds another image "on top" of it, the internal data representation of the added image, even if it is cut and pasted on top of the original HAM8 image, if it is cut back out, may or may not be the same because the pixel data may have been changed to make it work in the context of the original HAM 8 image. So take someone who does a lot of video work, who may wish to cut and paste between scenes, and I can see very easily where, without careful planning, there is some "loss" involved here.

To be fair, most images are stored in the "lossy" JPEG format, but there is still a proliferation of TARGA and other 24-bit compatable formats where the premium is on the accurate representation of the data, NOT the size of the file. That being the case, I think that while HAM 8 has its uses, I believe that it is not a true substitute for a true 24-bit display, especially when you consider how operations on a HAM8 screen may (or optimistically, may not) alter the representation.

Dave Thedens (thedens@boi.hp.com) wrote:

[...]

: If Atari has learned one thing from SEGA it is to release the hardware when you
: have software to run on it. And I do not consider ports of 16 bit games to be
: the software that I expect on this generation of machines.

I hate to tell you this, but quite a few of the new "Jaguar" games are
going to be rehashes of old arcade games. These are mainly 8-bit
classics. They might be old, but probably are still fun. New doesn't
always mean better. I can name quite a few "latest games" that are
pretty naff.

I'm trying to collect an old Atari 800, Commodore 64, Vic-20 and
Vectrex to add to my game collection. There's still quite a bit of
fun to be had with yesterday's hardware.

: : You guys are quite sad. Considering all it takes to develop for CD32 is for
: : previous Amiga developers to port their software over to CD format, your
: : machine will absolutely be BURIED by the competition if all your company hopes
: : to offer is a measly 20 or 30 measly games.

: Well if these are games that due justice to the hardware in the Jag then the
: CD32 will die a quick death. I will admit that C= ships well in europe. Part
: of that may be that in some segments of consumer electronics they are years
: behind and that a system with a dinky 68020 would impress them.

I think the first generation of games on any platform are going to be
rather weak. The first PC CD-ROM games were just hehashes of floppy/
hard-drive based games. The SNES 3rd party games weren't a lot better
the the NES games to start off with.

Time will tell how much the developers are going to spend (time and money
wise) developing titles for the CD^32, Jaguar and 3DO. There's a lot
of developers signed up, but very few good new titles on the shelves.

The CD^32 hardware is good compared to what's available in the stores
(in Australia and Europe at least), which are mainly the Super Nintendo
System and Sega Genesis/MegaDrive. It will be interesting to see who
wins the marketing battle.

I don't think we'll see a definite winner until mid-year 94, as Atari
are only making 50,000 unit this year, which doesn't really mean a whole
lot of owners buying games. I don't think many recreational games
sell over 50,000 anyway. Some best sellers sell 100,000+ (Ultima 7, a
few Amiga games in the UK).

I personally wouldn't throw my money on any platform until I can see
lots of software I like on the shelves.

- Jim

>

Wrong! You clearly do not know what you are talking about. It isn't hard to design extra circuitry to allow a 68000 to talk to 64-bit wide memory. When properly done, this memory appears to the 68000 as extremely fast 16-bit wide memory while the other chips (true 64-bits) can access this memory at the full 64-bits.

Think about it. If someone can make a 32-bit 68030 talk to 16-bit wide memory (as in the Falcon and Mac LC II), then it should be possible to do the opposite (i.e. allow a 16-bit 68000 to talk to 64-bit wide memory).

By the way, are you for real? I hope you realize that your actions are having the opposite effect. Because of you, I'm sure a lot of people won't even consider a CD32 now...

What you're missing is that the ports from A1200-->CD32 are literally
ports of games, with no enhancments (or very few at best!) whereas the
ports for Jaguar that "rehash" old titles are redone, and recoded to
show off the Jaguar.

For example, look at Tempest 2000. This game will offer both a clone
of the original arcade game and an enhanced game that is different. This
will probably satisfy die hards who always wanted this vector monster
while also wowing those who never saw the original.

Source?

The Jaguar has 32-bit graphics ... 24 bit + 8 bit alpha plane .. if you don't
know what that is go flush yourself down the nearest toilet ..

CD> The CD32 can display >262144< colors AND animate at that resolution, from
CD> a
CD> pallete of 16.7 million.

Yep, but not while playing.

Sometimes they do. Often times what I see in Amiga eurodemos' I end up seeing
popped up in games about 6 months later...Copper plasma, Glenz-vectors,
realtime rotation & zoom..

Did I infer that that was all an Amiga could do, is just one? Ive got a demo on my hard drive that allows the user to mouse-control the rotation of a cube, with each side of the cube having a different graphic image.. The rotation of the cube is controlled in realtime, 50 FPS. This, on a machine 1/4th the CPU horsepower of a CD32, and 1/2 the graphics bandwidth. An Amiga is an Amiga, my friend.. :)

>
>Advantage of the cd32: you can have a series of pictures directly read in from
>the CD. But is there a CinePak/Mpeg decoder build in in ~standard~ ?

Who needs MPEG to do that? all an Amiga CD32 has to do is load an .ANIM8 file into its 2 meg of highspeed 32-bit wide memory, and play the animation directly out of that, in 262144 colors..Meanwhile, since the CD32 can multitask internally, it can pull up more graphics data from the CD and have -IT- ready to go when its time to be played. Ive been doing that on my Amiga 2000 already for years.

Your Jag has a PALETTE of 16.7 million. It cant display all of them at one
time. Only 65536.

The CD32 also has a PALLETE of 16.7 million, however, it can display 4x as many
colors simultaneously, and animate them, where the Jaguar cannot. 262,144
colors.

Go inform yourself before breathing any longer.

A valid point. You get an effect similar to that of continually compressing and decompressing a JPEG, in that the picture slowly degrades in quality. What a lot of packges do is work with 24 bits internally, and use HAM as a display method.

|>
|>
|> To be fair, most images are stored in the "lossy" JPEG format, but there

|> HAM8 screen may (or optimistically, may not) alter the representation.

HAM is very good for displaying rendered/digitised pictures and animations (in the same way that JPEG and MPEG are good at storing them cheaply), because of it's memory usage and bandwidth. The best way to use it, as I've said, is to perform all your operations on a virtual 24 bit display, then just use HAM to display that data, rather than working directly on the HAM image in memory.

# 2919. Jaguar Add

Newsgroup: comp.sys.atari.advocacy
Date: 1993-11-24 00:13:24 UTC
From: foster@rufus.nsc.com
Message-ID: <1993Nov24.001324.21945@berlioz.nsc.com>
Source record: 20122

Yes, I did see a real live television add for the Atari Jaguar on Monday Nov. 22nd.

It had this group of teen age kids getting into an elevator and stopping at the 16th floor to see Sega and Nes and then proceeding to the 64th floor to see the Atari jaguar. With "Four times the playing power".

I know a few people who work at atari and the said that there will be three titles available with the release of the machine this Wednesday.

I have put down a 10% deposit at the Good Guys to pick mine up on Wednesday or Friday depending on when my San Jose outlet gets theirs from the main distributors.

My friends at atari me said that the beginning 50,000 units have already been sold, ( to stores that is ), so you consumers can still get yours.

Anyway, Just some info.

Paul

: >half a million units.

: A high quality plant in the Phillipines... far superior manufacturing method
: than the IBM/Motorola deal Atari has, huh? :)

You should check out the reviews of the Ambra and PS/2 lines that
IBM produce. They're not exactly the best of the bunch when it comes
to reliability or performance, especially the Ambra. It's having a lot
of teething problems. Unless you want to say US robots are better
than robots in the Phillipines. Most of the US based hard-drive
manufactures assemble their units in Asia (Western Digital and Conner
do, and they make the fastest drives in the <500MB range).

: And let's look at quality and quantity... how many defects per 1000 units
: with this production method?

: And if so many peopel have CD-32... where are they on Internet? Or are we
: to assume they aren't capable of using it? :)

Most likely in Europe and the UK. Hate to tell you this, but if you
look at internet, you see'll its predominantly US-based. Try doing
a sample of the posters. Then look at the networks in Europe, which
are predominantly FidoNet and Janet (in the UK mainly). Internet is
not a good demographic cross-section of the population. I sure as
hell wouldn't be using it for cross-sectional panel data time series
analysis, unless I wanted to track what computer science and
electrical engineering students were doing, or mistakenly believed that
90% of the world's population were students.

: There were 1600+ messages in rec.games.video.misc on my site as of yesterday.
: Over 70% were related to the Jag and 3DO. less than 1% were related to
: the CD-32.

: I bet this moron doesn't even know what "multi-session" means for a CD-ROM. :)

Required for playing back of Kodak CD's because the index can be re-
written and the drive must be smart enough to look elsewhere for new
information.

: And the 30 titles are straight ports of A1200 games, making the console
: useless for those who'd care about it... prior Amiga owners...

Usually they include an audio CD track and extra levels, etc, just like
the PC CD-Rom games.

: The unit is 64 bit graphics/blitter/risc cpu, 32 bit sound/dsp, 16/32 68000.

Where did the 16/32 68000 come from? What does the 32 bit mean?

: Commode would do well to do SOME kind of marketing. No one in the USA knows the

Lucky the US isn't the only market in the world then?
We've got the rather crappy CD^32 ads over here in Australia. It's
okay compared to the Sega and Nintendo systems over here and
suprisingly Sega have reduced the price of their CD + console package
to under the CD^32 price point by A$100, wheras it used to be $300
over.

I'd prefer more honesty in advertising. Atari was found to be running a
campaign that was likely to mislead and deceive a reasonable consumer
over here in Australia by the advertising standards council.

Proof??? EXCUSE ME? BUT DON'T YOU EVEN TRUST ATARI?

PROOF FOLLOWS:

0------------------------------- (Sheesh Rickard, this shows you how misinformed you are!)

Ok, dudes, here it comes... the Genie online conference concerning the Jag's rollout. Finally...

Here is an unofficial transcript of Bob Brodie's "Dateline: Atari" November 4, 1993, the day of the Jaguar rollout! This file has not been edited except to remove unneccessary items and to make it more visually appealing (and readable).

<[HoST] ST.LOU>
This is the night we've been eagerly anticipating ... the official Jaguar roll out from New York City with a live report on the news conference held just two hours ago.
As usual for our Dateline Atari RTC's, our special guest is the Director of Communications, Bob Brodie. Despite a very hectic and exciting day, Bob has chosen to give GEnie users the first accounts of this evening's news conference.
Elsewhere in the Atari ST RoundTable there is growing excitement about the Jaguar, the host of new game developers and the unbelievable climb of Atari stock which hit a high of 12 1/8 today!
Now, without further ado, heeeeeeeere's Bob!

[stuff deleted]

<[ScottJ] S.CORLEY1>
Bob, why did Atari raise the list price of the Jaguar by $50? Also
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
do you have any idea of the price that Jaguar games will sell for?
Thanks. GA.

<[Bob & Ron] BOB-BRODIE>
To cover the cost of the included game, which was a bit more than
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
we had expected it to be. The price of the games will be in the
49-89 range, depending on the title, and the developer. ga

<[Andy] L.SMITH70>

[stuff deleted]

AS _ALWAYS_, YOU ARE WRONG. The Jaguar does have _a_ graphics mode which only
displays 65536 colors. However, every resolution also has a 24-bit mode.
The Jaguar in NOT limited by 65536 colors.

These are words repeated all over rec.games.video.misc. They have been
repeated by Atari itself, actual Jaguar programmers, and casual observers.

SHUT THE FUCK UP.

The 68000 has always been 16 bit /32 bit. according to a book I have, the registers are 32 bits wide. In fact, the letters ST for the atari series mean SIXTEEN/THIRTY TWO and the TT stands for 32/32.

WHich is why I'd rather have 16 bit true (direct, whatever) color, since
the lossyness fo 16 bit color is the least significant bits, but HAM-8 might
actually dramatically change a pixels value (i.e. proghter or darker than
necessary, more green percentage wise than it should be, etc...)

Charles Medley (cmedley@wam.umd.edu) wrote:
:In article <CGxq01.LJM@news.hawaii.edu>, Jimmy Chan <jimmy@Hawaii.Edu> wrote:
:#Well, here's my point:

:#Donley claims the Jag is not as good as CD-32 because it lacks a CD-ROM.
:#Never mind that you can add one later, and still come close to CD-32's
:#price, with the prospect of even better performance....

If I was to buy a games console now it would have to have a CD-ROM
available with it. Not something that will/might show up later. If in 6
months, the Jaguar does have the CD-ROM available then it'll be in
contention with my choices of games console. If it isn't around by then,
well it's out of contention with my buying choices. If people want to
stick to catridge base for awhile then that's their choice. My choice is
CD-ROM.

:#Now, let's say Donley is right, and the CD-ROM is "all that"... well,
:#what good is that device if the games being ported are all able to
:#fit on a cartridge anyways? I've seen 3DO games, and in the case of
:#the title that comes with it (Crash 'N Burn), I know Sega or SNES would
:#be hard pressed to put something like that on a cart. The Jaguar's
:#carts are higher capacity, and could do it (or at worse, come very close!)
:#and have no "load time" involved.

That's if the games being put on CD-ROMs can fit on a catridge. In my
experience the majority of stuff coming out on CD-ROMs will not fit on a
catridge. I've seen Crash 'N Burn, nice, but I don't really go for racing
games. Not my type of fun, sorry.

:#So I'm wondering... what good is this advantage until software comes
:#out that demands the added storage?
:#Price isn't a factor... the games cost as much as cart titles.
:#Speed is slower than a cart.
:#Storage... well... if it's not being used, it's a waste.

The software that's been coming out for CD32 CD-ROM disks can't be piled
into a catridge without losing a lot of other things that enhances the game.
Given your words, what good is the Falcon advantage if software that comes
out that demands the added storage isn't available?

I think the stages for Jaguar software development will follow along
something of these lines, IMHO:
For Atari to provide a catridge based system will only insure
that developers will have to squeeze down the size of the code to fit on
the catridge. That's going to leave the Falcon with an initial slew of
catridge games that will not be showing off everything the Falcon has to

give until a CD-ROM player comes out.

This also, brings into question the next phase of software development. For awhile developers will be still producing games for the Jaguar on catridges, even after the CD-ROM becomes available since the catridge based consoles will be their low-end until a larger number of CD-ROM units are sold.

Third phase, the Jaguar will be seeing many ports of catridge based games to CD-ROM disks so, it'll be facing the same thing as the A1200 -> CD32 ports. Most of those CD-ROM ports will carry extra sound, levels, etc.

The last phase is that the Jaguar will begin seeing more games being available on CD-ROM and shows off the capabilities of the Jaguar.

Because of Atari providing a catridge based console, it'll take the Jaguar a much longer time in reaching the final phase of software development than if they had initially came out with a CD-ROM based console.

:#I'm not saying CD-32 is a bad system, only that it's ridiculous for
:#anyone to claim it can stomp on the Jaguar.

Well, I'm not saying that the CD32 is the best on the market, but it is better than the Nintendo/Genesis systems. It also has a good initial price and has been showing a lot of developer support. I believe C= stated about 75 CD32 titles should be out by end of this year. I wouldn't claim that the CD32 will stomp the Jaguar as each has their merits. Same goes for the 3DO though I still don't like that price tag.

:#(in fact, i really don't think it will be able to compete with Jag
:# in the marketplace because of the keywords "64-bit" and the 24-bit
:# video...)

Remains to be seen.

:#>Another developer had stated their Pinball Illusions or with it Fantasies,
:#>whatever, will come out more levels for the CD32 version than the Amiga
:#>version.
:#>
:#Not to be too inflammatory, but if only one title shows marked improvement
:#over the A1200 version, what is the purpose of CD-32?

Geez, that was only used as an example of what I had posted earlier about. One title doesn't mean that's all, did you want a listing of what every developer said they are planning on?

>> bandwidth horsepower as the CD^32's AGA chipset, it would be only true to say
>> that CD32 could do it better, AND faster.
>With that you get ONE picture rotating. With SNES you get ONE picture rotating
>AND projected in 3D (well u can do more...). With 3DO/Jaguar you get loads of
>pictures rotated and 3D-projected.

Did I infer that that was all an Amiga could do, is just one? Ive got a demo on my hard drive that allows the user to mouse-control the rotation of a cube, with each side of the cube having a different graphic image.. The rotation of the cube is controlled in realtime, 50 FPS. This, on a machine 1/4th the CPU horsepower of a CD32, and 1/2 the graphics bandwidth. An Amiga is an Amiga, my friend.. :)
---

And that is the whole problem with the CD-32.
Extrapolating your figures in the kindest possible way gives you:

6 faces at 50 fps * 2 * 4 = 48 faces at 50 fps
= 96 faces at 25 fps
= 192 faces at 12.5 fps

I'm so nice, I'll give you 400 faces at 12.5 fps (though I honestly doubt the CD-32 could handle that).

The Jag and 3DO eat this figure alive, measuring the number of faces they can manage in the THOUSANDS. Perhaps you do not grasp it yet but the Jag and 3DO offer a quantum leap in 3d graphic performance, to admit otherwise is to shut your eyes to the TRUTH.

Also, I don't suppose you were doing those rotations on a machine with fast ram, were you? Don't forget the CD-32 comes with only chip-ram, and from the billions of discussions on this very base we realize it takes almost a %50 performance hit with only chipram.

>
>Advantage of the cd32: you can have a series of pictures directly read in from
>the CD. But is there a CinePak/Mpeg decoder build in in ~standard~ ?

Who needs MPEG to do that? all an Amiga CD32 has to do is load an .ANIM8 file into its 2 meg of highspeed 32-bit wide memory, and play the animation directly

out of that, in 262144 colors..Meanwhile, since the CD32 can multitask internally, it can pull up more graphics data from the CD and have -IT- ready to go when its time to be played. Ive been doing that on my Amiga 2000 already for years.

---

What you do need MPEG for is if you want to measure video you can fit on a CD in hours instead of seconds.

>I can aslo get 784*550 non interlaced. and 800*600 interlaced at over 90Hz
>(although not in 256 colours)

The F030's video chip has a limit of 33 megs/second. Subtract Vblanks
and you usually have ~26 megs/second.

You can set the screen resolution to any value with x/16=int(x/16) and
y/16=int(y/16). I had it set to 800*608@54 Hz (256 colours) and decided
it flickered too much. Then I chose 7xx*5xx@66 Hz. As I only have a
NEC3D, I couldn't set the refresh rate higher than 800*608*60Hz (16 colours).
I am using BlowUp030 Hard II, the software only version gives less, but
not very much less, if you have a NEC3D (MUCH less if you have a NEW
Multiscan). With the NEC3D, I was also able to set the 16 bit mode to
800*608 (~60 Hz interlaced, this is a 20kHz mode), and to 5xx*3xx@66 Hz.
Oh, btw: I also use 1024*768@87 Hz interlaced (16 colours, monitor limit)
and 896*6xx@87 Hz interlaced (256 colours, F030 limit).

The parameters for the 16 colour modes are also valid for 2 and 4 colour modes,
only the memory usage is different (and this makes the 4 colour mode
virtually worthless, IMHO).

Actually, a number of people in rec.video.games.misc have now reported
getting thier Jags at babbages... Unfortunately, I mail ordered mine,
so even if the shipped it out this monday I'll have to wait a week or
so... Ack!!

They have just ignored the Jaguar so far! I think this is caused by Atari's policy only to inform american press members about their new machine.
The second games magazine ("ASM") has puplished a big article about the Jaguar (they where impressed - but nothing really new).

Ciao, Heiko.

Hah! In a paint program with perhaps 10FPS :-)
WHAT IS THE NAME OF THAT DEMO, I WANT TO SEE IT !!!!!!!!!!!!!!!!!
Because I have a demo on my harddisk showing 128 texturmapped 3D projected
and rotated polygons in 30FPS. But I won't show it to you because you would
say: 'Ah yes, like that you can do it'. Btw, it's mouse controllable and on
a Falcon.

During the game you see plasmas, glenz, rotations? I only see that during the
intro or highscores. To do that in a game is virtually impossible, or only with
slowdown in the game.

Can you give me that demo so that I can have a look on my own??? If you say
you have a 1vbl texturemapped cube, I want to see it! The only mapped cube I
saw on Amiga was long ago and had only 5-10FPS.
A mapped cube on falcon is about 20-30FPS and this is on a chuncky grafix card.
Don't tell me a 68000 can do texturemapping in 1vbl without having a

chunky to planar converter.

This has nothing to do with multitask on the CD32. But you are right, the big advantage of a CD based system is the possibility to play animations. But these animations are often limited and you will get a lousy Dragons Lair gameplay if you want to use those films as a gameplatform.

Why not. The abandoned Panther project had already 1000 (or was it unlimited)
number of polygons on screen. It was dumped because the Jaguar is better. The
Panther was a 32bit engine.

Well this is where I'm not sure of the benefits of HAM8 for some uses.

If the program is using a 24-bit representation somewhere else, it is probably kept somewhere other than chip RAM, and it's going to be very large for a decent sized screen. So that negates the beauty of HAM8 as a RAM efficient scheme for displaying hundreds of thousands of colors.

If, on the other hand, we stick to using the 8-bit representation, then we can get this lossy effect I described in the first posting.

This is, I think, the basis for the claims that HAM8 isn't so great for animation... I think this may indeed be the case for, say, some video games and any video packages that would allow cutting and pasting between two images.

(can anyone here believe we have just had the first intelligent series of postings to discuss an Amiga in an advocacy group? :) )

>
> ~Chris

Well, to be fair to the Amiga AGA advocates... they do have the capactiy to
display an image with more color. I would hazard a guess that their claims
that they have nearly perfect renditions of images converted from 24-bits
is probably true.... however, I do doubt they could do losless image
manipulation involving combinations of images that began life as 24-bit
images.

But... while the Falcon's 65536 color mode is losless.... it's also
"only" 65536 colors. In some ways, it's more accurate as it would
only lose the least significant bits of color, but... can't the same
argument be made for a 256 color display?

I think the A1200 would kill us with images that have aliasing... HAM
would naturally smooth it out... however, that same effect may not
be so desirable (in my opinion) for other applications.

I'm interested in hearing about how they use the 64 base colors to
keep things from getting blurred.... because I can't imagine how
that algorithm would work in a paint package where the user may
choose from any of 16.8 million colors....

Well, what games being released for the CD-32 that are ports of A1200 games
can NOT fit on a few floppy disks?

And given that the Jag's cartridges are able to hold as much as (at least)
4 or 5 of the A1200's double sided, double density (880k) disks, why would
such a game not be able to fit on a Jaguar cartridge?

So I think the catch is... right now, the games for the CD-32 are ports
of A1200 games that were distributed on floppy. I've heard of 4 and 5 disk
games... so that's about 4MB.

4MB will fit on a Jaguar cartridge... so... why make the consumer pay
for a CD that they don't need? Like I said, no one has charged
any less (yet) for a CD game than for a catridge game... except Phillips

CD-I, and that's an effort to move machines with cheap software.

>Given your words, what good is the Falcon advantage if software that comes
>out that demands the added storage isn't available?
>

What things are you talking about that won't fit on a cartridge but
can fit on a CD-ROM?

These games were originally on the Amiga 1200. So what you're saying
is that the "frills" that are added on make the games for CD-32
better than the A1200 versions?

And what are you talking about the Falcon for? How does storage relate
to an Atari computer? It can use CD-ROMs, hard drives, etc. etc...
and comes with a high density floppy...

>I think the stages for Jaguar software development will follow along
>something of these lines, IMHO:
>For Atari to provide a catridge based system will only insure
>that developers will have to squeeze down the size of the code to fit on
>the catridge. That's going to leave the Falcon with an initial slew of

>give until a CD-ROM player comes out.
>

The cartridges can hold up to 40 Mb (and this could be either megabytes or
megawords or, at worst, megabits) of data.

Say it's mega"bits". That's 5MB.

That's more than 5 floppy disks for an A1200 game.

Now, if CD-32 games are just reissued ports of A1200 games, how many do
you think are going to exceed that size?

Are they going to show off the CD-32's power?

>This also, brings into question the next phase of software development.
>For awhile developers will be still producing games for the Jaguar on
>catridges, even after the CD-ROM becomes available since the catridge based
>consoles will be their low-end until a larger number of CD-ROM units are
>sold.
>

This is an assumption. CD units for the Jaguar have already been shown in final form, and I would counter your negative assumption with the positive one that they have them in developer's hands already.

In fact, Atari did state the CD unit won't ship until they have a base of software for it to make it worth purchasing.

>Third phase, the Jaguar will be seeing many ports of catridge based games
>to CD-ROM disks so, it'll be facing the same thing as the A1200 -> CD32
>ports. Most of those CD-ROM ports will carry extra sound, levels, etc.
>

You are jumping to conclusions rather quickly. If they only have "24" games to begin with, how many ports are they going to make of the original 24 to CD, hmmm?

Odds are equally good they will have new titles... however, you are simply speculating now in an attempt to bring the Jag down to the CD-32's level because the issue of A1200->CD-32 ports is damaging the CD-32's reputation.

>:#>
>:#Not to be too inflammatory, but if only one title shows marked improvement

You're dead wrong. While most people here wish you were just dead, I will
be nice and point out that you are wrong.

The Jag can do many video modes, but every mode has a 24-bit display in that
resolution. Anytime you need 16.8 million colors, you can do it, or as
many of them will fit on your screen.

(you need a 4096x4096 display to get a 16.8 million pixel display)

> As it zooms into the graphic image, it rotates, you zoom out, its still
> rotating.. Its quite cool.

I am not sure how many people realize this, but these screens on the Amiga's
and Atari's that run these "EuroDemos" usually require about 1 meg of ram
and all the available CPU speed.. Its a challenge for them to keep the
screens below 1 meg, and squeeze the processor to the limits.. Thats why
you NEVER see games with these types of effects... OR when you do, teh games
are stripped of detail and the animation becomes jerky.. This is where I
beleive the Jaguar will prevail because of its multi-chip design.. The custom
chips for graphics and sound (sound mainly the DSP) can be used for almost
any task besides what they were placed in there for.. The DSP is mainly a
NUMBER CRUNCHER..

I hope nobody replies to this.. Just for Mr. Donely's info really..

: takes almost a %50 performance hit with only chipram.

What systems allow for simultaneous access to the same piece of RAM?
How do they handle the bus->ram arbitration? I don't think either
the 3DO or Jaguar come with dual poreted VRAM.

Won't they suffer the same problem with respect to access RAM?
Admittedly they have a high bus bandwidth according to the specs, but
most of the figures seem to be extrapolated from the best case scenario.

Although your argument has sense--its not rrally applicable. Ive seen hundreds of HAM8 images, and hundreds of 24-bit images (both those that ive created, and those that ive scanned) And there is NO detectable difference.

A 24-bit image, means it can have -up to- 16.7 million colors. Rarely ANY 24-bit graphics use more than about 300,000 dictinct colors. Take a look at any 24-bit image with an image-processing program that can do pixel counts, and youll find this to be true.

HAM8 offers 262,144 colors per image.. That means, that any AGA-chipset Amiga (as in the Amiga CD32, the A1200 or A4000) can display TRUE 24-BIT graphics on

resolutions up to 512 X 512.

(512 X 512 = 262144 pixels) So you can have a diffent color for exery pixel at that resolution...Any of them, your choice from a pallete of 16.7 million.

Any resolution, as long as the number of pixels displayed at that resolution is lower than 262,144... It is THE SAME THING as actual 24-bit graphics. Youll notice that 640 X 400 = 256000 pixels.. So a CD32 can display in true 24-bit in this resolution as well.

Source record: 20291

Charles, what you are saying about starting with a Ham8 image
and then start to say, cut and paste, manipulate and then you lose
some quality is true if you do this directly.

However, some program like ImageF/X and Brilliance keep internally
a 24-bit information, so what you see on the screen is the Ham8's
approximation, and it always looks near 24-bit quality.

Ham8 does the following for every pixel: it can load immediately
one of the base 64 color registers, so if you are going from black
to white, and you have white in one of those registers you can display
it immediately. This is like having at least a native 64 color mode.

*OR* for every pixel, it can alter the most significative 6 bits
of one of the R(ed) G(reen) B(lue) intensities of the dot to the left
of the current dot and display that as a new color.

By choosing an appropriate setup of 64 colors you can minimize
'fringe' effects to a point that the image in 640x YYY looks near
24-bit quality. On a TV it would be practically indistinguishable.

Another myth (spread my Master liar Rickard) is that you can't
animate or make a game in Ham8, which is of course utterly false.

You can combine the sprites on top, or if you use a clever scheme,
you can make the background use one of the base 64 color registers
on every odd column, same with the bobs ('blitter sprites') and move
it in increments of two. If you do this on a 640x200 screen, the
movement will still look '320x200 standard mode', and the background
will look darn colorful.

I hope this satisfy your curiosity Charles. Thanks for your
objectivity.

# 2958. CD32's HAM8 mode -IS- True 24-BIT color in some resolutions.

Newsgroup: comp.sys.atari.advocacy
Date: 1993-11-24 14:49:33 UTC
From: cdonley@amiganet.xnet.com
Message-ID: <cdonley.2p3b@amiganet.xnet.com>
Source record: 20288

Just to clear things up, here:

AGA chip-set Amigas, such as the Amiga CD32, the Amiga 1200 and the Amiga 4000 have a color pallete of 16.7 million colors.

The "HAM8" mode allows AGA Amigas to display up to 262,144 colors chosen from that pallete of 16.7 million.

Now, if you have a screen resolution like 320 X 200 or 640 X 400, the number of PIXELS on the screen comes out to be FEWER than 262,144 -- Do the math!

Now, since the Amiga has 262,144 colors available at these resolutions, it can have a different color for every pixel on the screen -- In effect, it is NO DIFFERENT from actual 24-bit graphics, because the number of colors chosen from a 16.7 million color pallete is greater than the number of pixels available to paint on!

Repeat: There is NO DIFFERENCE between a HAM8 and a pure 24-BIT image, as long as the resolution of the screen does not exceed 262144 pixels. This means that a 24-bit image and a HAM8 image are IDENTICAL, up until (roughly) 640 X 400.

Hope that clears things up.

Of course they are. Thats the wonderful thing about CD-Roms that the Jaguars
still can only dream about--full motion video, straight off the disc. Too bad
your Jag's CD-Rom is only vaporware. True CD sound, as well.

>
>

Right. Your Jaguar can only do 65536 colors on one screen (and thats just a
static display. A Jaguar (or a Falcon for that matter) cant animate in its
65536-color mode.

Your Jag can do 24-bit, as long as the screen resolution that youre using
contains fewer than 65536 pixels.. In otherwords, your Jaguar can do 24-bit in
320 X 200, and thats it. (320 X 200 = 64000 pixels)

The CD32 on the other hand, can have displays identical to 24-bit at 320 X 200,
320 X 400, 512 X 512, and 640 X 400, since a CD32 can display 4 times as many
colors as your Jaguar, from a pallete of 16.7 million. Too bad for Atari.

Looks like you lose again.

Of course it doesn't...

Are you sure you really know the Amiga hardware. If you don't,
don't claim things.

I would be very astonished if these machines had a memory for the
palette of 262,144 * 3 bytes ie 768 KB !!!! That would be simply
silly.
I rather think that HAM8 has 2 bits to say to change one of R, G or
B composant of the color + 6 bits for the color. This gives just
262,144 colors. You don't choose them: they're set by the hardware.
The problem is that there's a bit config used for something I can't
think of.

Laurent

When are you going to understand that you're wrong? The Jaguar can display as many color as it has pixels in ANY of its graphics modes, the largest of which is 720x576.

And it certainly CAN animate in 24-bit color. Your stupidity doesn't even belong on a .advocacy group, but, unfortunately, there's nothing lower.

>Your Jag can do 24-bit, as long as the screen resolution that youre using

We told you a million times, the Jaguar can use 24-bit color in every resolution it supports. This is a fact. Learn to read. And listen to the licensed developers who have attested to this.

I don't think so. Take the Jaguar as an example. If divide the bandwidth with
2 we still got 50MB/s, which we can support any resolution upto 640x400x24
without any problems and still have bandwidth left.

Btw, I would guess that the CD32/A1200 should have aprox. 50-60 MB/s in band-
width (best case scenario). The 3DO I don't know enough about to speculate what
bandwidth it could have, but since they have the dual port VRAM I don't think
they will have any trouble with buscontention.

Wrong, it's a demo, so you have 3 polygons at once on screen.
That makes 48 faces in 25 fps
or 96 in 12.5 fps

Poor CD32... In creshent galaxy (sp?), a banal horizontal shoot-em-up, the enemies are not simply sprites, they are 3D gouraud shades polyhedial objects consisting of 24 triagles in true color.
An Amiga can barely put one such object on screen. A CD32 perhaps some more but you still have to make the shoot-em-up. No programmer will waste cpu-time to do 3D objects in a shooting game. But on the Jaguar this does not waste any time :-)

Full motion video: with what? Your optional MPEG unit? :)

Jaguar has a 16-bit DAC and DSP unit for sound, so we have the best of
both worlds... CD quality sound, and low overhead. Think of it... no
problem with playing CD music *while* loading, and it takes about as
much memory and effort as an Amiga MOD player, but with superior quality.

But you have not *edited* those images. Also, since we don't know what
kind of setup you have (i.e., are you using a high quality monitor?) we
can't tell if your perception of "loss" in the accuracy of your display
is accurate or not. This may be something someone may have to do contortions
to discover, or it may be something very common.

>A 24-bit image, means it can have -up to- 16.7 million colors. Rarely ANY
>24-bit graphics use more than about 300,000 dictinct colors. Take a look at any

True, but a 24-bit image may utilize colors of with variations on the
256 intensities of red, green, and blue... and this means that when
a 262,144 color display attempts to approximate it, it may come close,
but not be able to exactly recreate that image, especially in the digital
domain.

>
>HAM8 offers 262,144 colors per image.. That means, that any AGA-chipset Amiga
>(as in the Amiga CD32, the A1200 or A4000) can display TRUE 24-BIT graphics on

>(512 X 512 = 262144 pixels) So you can have a diffent color for exery pixel at
>that resolution...Any of them, your choice from a pallete of 16.7 million.
>

I'm not sure that is possible, considering you may have the 64 base colors
to aid in transitions between pixels, BUT you may have certain combinations
that won't be possible in a 512 pixel scanline. For example, interpolating
a lot of the combinations of red, green, and blue in a single scanline would
probably result in a noticeable loss.

# 2971. CD-32 Recalled!

Newsgroup: comp.sys.atari.advocacy
Date: 1993-11-24 18:48:30 UTC
From: sebelt01@starbase.spd.louisville.edu
Message-ID: <sebelt01.754166910@starbase.spd.louisville.edu>
Source record: 20302

NEWS FLASH!!
(Nov. 23 21:30EST) Amiga, manufacturer of home computer systems and, more recently, a home video console, has recalled their CD-32 home entertainment system. Doug Gunnit of Amiga was quoted as saying `There are some features that need to be worked out that can't be accomplished in the field'. Reported bugs include incompatibility with the standard AGA chipset and a seemingly random bus-error resulting in failure of burst-mode memory writes. This, of course, was no surprise to the industry; they knew the CD-32 was a joke all along, and that anyone on comp.sys.atari.advocacy who sticks up for the CD-32 is a f*cking idiot. Amiga's suck, bite me! Atari forever.

Thanks for reading this public service announcement.

: fast ram, were you? Don't forget the CD-32 comes with only chip-ram,
: and from the billions of discussions on this very base we realize it
: takes almost a %50 performance hit with only chipram.

What systems allow for simultaneous access to the same piece of RAM?
How do they handle the bus->ram arbitration? I don't think either
the 3DO or Jaguar come with dual poreted VRAM.
------------------------------

Actually, the 3DO does. (you better get something for $700!!) It
comes with 1MB VRAM, and 2 MB RAM (but don't forget the 3DO OS is like
800k...) My point here was that the CD-32 is really just an A1200
with no fastram, and will thus be slower than a A1200 with fastram.
The jaguar gets around this somewhat by having the graphics chip
access the memory 64-bits at a time, and also has a cache.

Won't they suffer the same problem with respect to access RAM?
Admittedly they have a high bus bandwidth according to the specs, but
most of the figures seem to be extrapolated from the best case scenario.
------------------------------

Well, the high bus bandwith is part of it, but also the 3DO and Jaguar
have chips taht are really good at doing 3D stuff. Crash & Burn seems
to handle a couple thousand (at least) texture mapped polygons and
includes stuff like transparency to boot. Cybermorph throws a LOT of
gourad shaded polygons sround really quickly, all at a high frame
rate.

Charles Medley (cmedley@wam.umd.edu) wrote:
:In article <CGxq01.LJM@news.hawaii.edu>, Jimmy Chan <jimmy@Hawaii.Edu> wrote:
:#Well, here's my point:

:#Donley claims the Jag is not as good as CD-32 because it lacks a CD-ROM.
:#Never mind that you can add one later, and still come close to CD-32's
:#price, with the prospect of even better performance....

If I was to buy a games console now it would have to have a CD-ROM
available with it. Not something that will/might show up later. If in 6
months, the Jaguar does have the CD-ROM available then it'll be in
contention with my choices of games console. If it isn't around by then,
well it's out of contention with my buying choices. If people want to
stick to catridge base for awhile then that's their choice. My choice is
CD-ROM.
------------------------------

Ok, I'll respect that...

:#Now, let's say Donley is right, and the CD-ROM is "all that"... well,
:#what good is that device if the games being ported are all able to
:#fit on a cartridge anyways? I've seen 3DO games, and in the case of
:#the title that comes with it (Crash 'N Burn), I know Sega or SNES would
:#be hard pressed to put something like that on a cart. The Jaguar's
:#carts are higher capacity, and could do it (or at worse, come very close!)
:#and have no "load time" involved.

That's if the games being put on CD-ROMs can fit on a catridge. In my
experience the majority of stuff coming out on CD-ROMs will not fit on a
catridge. I've seen Crash 'N Burn, nice, but I don't really go for racing
games. Not my type of fun, sorry.
------------------------------

But the Jaguar provides a larger cartrige space and hardware
compression so you can stuff a lot of graphics into a cart, this
overcomes some of the space problem. You could probably fit any of
the CD-32 10mb games into a Jag cartridge.

:#So I'm wondering... what good is this advantage until software comes
:#out that demands the added storage?
:#Price isn't a factor... the games cost as much as cart titles.
:#Speed is slower than a cart.
:#Storage... well... if it's not being used, it's a waste.

The software that's been coming out for CD32 CD-ROM disks can't be piled
into a catridge without losing a lot of other things that enhances the game.

Given your words, what good is the Falcon advantage if software that comes out that demands the added storage isn't available?
---

It can in a Jag cartride, as long as most of the 10MB or so is graphics. A friedian slip on your part saying Falcon?

---
I think the stages for Jaguar software development will follow along something of these lines, IMHO:
For Atari to provide a catridge based system will only insure that developers will have to squeeze down the size of the code to fit on the catridge. That's going to leave the Falcon with an initial slew of catridge games that will not be showing off everything the Falcon has to give until a CD-ROM player comes out.
---

Not code, but graphics... it's really the graphics that suffer the most cutback in a cart system. I think that you can show off quite a lot of what the Jaguar (you said Falcon again, tsk tsk) can do with 2 MB of code and 12 MB of graphics...

This also, brings into question the next phase of software development. For awhile developers will be still producing games for the Jaguar on catridges, even after the CD-ROM becomes available since the catridge based consoles will be their low-end until a larger number of CD-ROM units are sold.
---

Some games just don't need a CD-ROM. I myself anticipate games that use both the cartrige and CD-ROM, if done cleverly this could really enhance a game!!

And I think that a number of ports like 7th guest and Dracula will be out soon after the CD release anyway. You can play these until truly original Jag CD games later.

Third phase, the Jaguar will be seeing many ports of catridge based games to CD-ROM disks so, it'll be facing the same thing as the A1200 -> CD32 ports. Most of those CD-ROM ports will carry extra sound, levels, etc.
---

No they won't. Why would a game already on cart beconverted to CD-ROM? That makes no sense. Perhaps a sequel or something, but not a direct port.

The last phase is that the Jaguar will begin seeing more games being available on CD-ROM and shows off the capabilities of the Jaguar.
---

This will take a little while, but some developers have Jag CD's right now, so it may happen sooner than you think.

---
Because of Atari providing a catridge based console, it'll take the Jaguar a
much longer time in reaching the final phase of software development than
if they had initially came out with a CD-ROM based console.
---

not that much longer, and if our CD part breaks down the whole machine
isin't unusable.

:#I'm not saying CD-32 is a bad system, only that it's ridiculous for
:#anyone to claim it can stomp on the Jaguar.

Well, I'm not saying that the CD32 is the best on the market, but it is
better than the Nintendo/Genesis systems. It also has a good initial price
and has been showing a lot of developer support. I believe C= stated about
75 CD32 titles should be out by end of this year. I wouldn't claim that
the CD32 will stomp the Jaguar as each has their merits. Same goes for the
3DO though I still don't like that price tag.
---

I agree with everything here.

:#(in fact, i really don't think it will be able to compete with Jag
:# in the marketplace because of the keywords "64-bit" and the 24-bit
:# video...)

Remains to be seen.
---

The only thing I question is how the CD-32's colors will be presented
to the public, since they can't really say 24-bit color, and the truth
is too confusing for most consumers. I guess ity doesn't matter that
much, they can just call it a 32-bit machine.

:#>Another developer had stated their Pinball Illusions or with it Fantasies,
:#>whatever, will come out more levels for the CD32 version than the Amiga
:#>version.
:#>
:#Not to be too inflammatory, but if only one title shows marked improvement
:#over the A1200 version, what is the purpose of CD-32?

Geez, that was only used as an example of what I had posted earlier about.
One title doesn't mean that's all, did you want a listing of what every
developer said they are planning on?
---

Well, actually, yes we do. We've had them for the Jaguar and 3DO...

|> >the lossyness fo 16 bit color is the least significant bits, but HAM-8 might
|> >actually dramatically change a pixels value (i.e. proghter or darker than
|> >necessary, more green percentage wise than it should be, etc...)

In the worst possible case, it takes HAM8 3 pixels to hit any given colour within the 18 bit 262144 colour range (more for any pixel within a 24 bit range, but displaying 16777216 colours in HAM8, although easy to do, is not very practical, and more of an interesting footnote about the way it got implemented) These worst cases, are greyscale type effects, where the first pixel is close to the destination, the second pixel is very close to the destination, and the third pixel is exactly the desired colour. If you take 800*600 or 1280*512 HAM8 and do a greyscale across the screen, what you actually get something that looks exactly like a greyscale. When you zoom in close, you can see that some pixels have just a little tinge of pink, or yellow to them. On the full screen representation you can't see these slight errors, unles the resoloution is really low. Extreme changes (a sharp change from black to white, for example) can cause more trouble, but these tend to occur very rarely in most images (unless the image is specifically created to look bad in HAM mode, but images that consist of long, contrasting verticla lines aren't terribly interesting to look at anyway), and on the few occasions that these changes do occur, 64 base colour registers are more than enough to take care of them (Also, AAA will probably have HAM 10, as well as 24 bit, which will have 256 base colours, and a 24 bit HAM range). the case where 3 pixels are needed to change is very rare, and most of the time, the change can be accomplished straight away, or takes 2 pixels, and at 1280 pixels across, one pixel that has 1.5% too much red in it, out of several that are the correct colour is rather hard (impossible) to notice. (Yes, I do have a high res monitor)

|> "only" 65536 colors. In some ways, it's more accurate as it would
|> only lose the least significant bits of color, but... can't the same
|> argument be made for a 256 color display?

Yes, the problem comes when you need a lot of colours for ranges. Say, for example you have red, green and blue, slightly reflective balls, and you want to raytrace them all next to each other. I tried this in Imagine, and it looked really nice and smooth in HAM8. In 256 colours, the image was so badly quantised, it was useless. HAM6 is noticibly banded in colour transitions (unless you use a high resoloution, and dither it) because of the effective limitation of a 12 bit palette. A 15/16 bit palette is better than a 12 bit one, but not by much. HAM8 is 18, and colour transitions look almost as good as 24 bit. You can only notice the difference at very low resoloutions (320 pixels across can look dodgy if you aren't careful with your base palette, I haven't seen HAM8 in extra-low-res (160 across), but I imagine it would look pretty awful)

|>
|> I think the A1200 would kill us with images that have aliasing... HAM
|> would naturally smooth it out... however, that same effect may not
|> be so desirable (in my opinion) for other applications.

In my experience, the aapplications that HAM is not suitable for, generally don't need more than 256 colours at the mosty anyway. :-)

|>
|> I'm interested in hearing about how they use the 64 base colors to
|> keep things from getting blurred.... because I can't imagine how
|> that algorithm would work in a paint package where the user may
|> choose from any of 16.8 million colors....

As I said above, the base colours are only needed for rarely occuring extrreme colour changes, so 64 is plenty (after all, HAM 6 had some pretty amazing images at 320*512, with only 16 base colours). If you need more, you can always use dynamic HAM.

Any resolution, as long as the number of pixels displayed at that resolution is lower than 262,144... It is THE SAME THING as actual 24-bit graphics. Youll notice that 640 X 400 = 256000 pixels.. So a CD32 can display in true 24-bit in this resolution as well.
---

Well, you're getting closer, but I still don't think you can call it a "real" 24 bit image due to the fact that different colors next to each other will cause problems. You can either waste processing time making it look better, or have it look slightly wierd.

I'm sure it's great for stills and paint programs that can take the time to make the image look good, but it would take some overhead to use this mode for a game.

At any rate, at its best it is almost as good as the 3DO and Jaguar which offer real 24-bit color.

Right. Your Jaguar can only do 65536 colors on one screen (and thats just a static display. A Jaguar (or a Falcon for that matter) cant animate in its 65536-color mode.

Your Jag can do 24-bit, as long as the screen resolution that youre using contains fewer than 65536 pixels.. In otherwords, your Jaguar can do 24-bit in 320 X 200, and thats it. (320 X 200 = 64000 pixels)

>Jag: 768*576 in 32bit colour, that's a 16.7 mil col palette, and an 8-bit
>alphaplane.

It is painfully obvious that you don't have the hardware specifications
for the Jaguar. No sane programmer would ever use such a mode, since you
basically wouldn't be able to do anything else but display the screen. Not
to mention that it is absolute overkill to use anything over 400 pixels
horizontally since few TV sets are able to display the pixels properly at
those resolutions. And with the intrinsic memory restrictions of cartridge
games, the graphics set would be abysmal.

>CD32: Animations and pictures, 262.000 col, in games: 256.

256 colours are more than enough for most games. Coupled with the
copper and a good graphic artist, you can do just about anything with
that. You really should see some of the stuff we're working on.

>Where did you get the rest of your lies from?

One could ask you the same thing. You both seem to have difficulties
separating facts from fiction.

Get a book.

When going from one colour to another, you'll get fringes in HAMx (very visible in HAM6, but they're there in HAM8 too)

I have a Falcon, but I've programmed on an Amiga (my worst nightmare ... ) it was VERY easy to see the difference between HAM pictures and REAL 24-bit pictures ... VERY EASY ...

Boy .. read some specs ..

The Jaguar has built in JagPeg (sort of JPEG) compression, and Atari has licensed cinemapak for use with both the Jaguar and the Falcon ..

Can you guess what takes space in consolegames? Right, graphics .... can you compress graphics with Jpeg?

YES!

That's how you'll reach the 50 MEGABYTE figure .. (more than any CD32 game out!)

That's funny, since when I run my falcon on my TV at 768 x 480 overscan
it looks fine to me. Definitely better than 384 x 240, even with interlace.
And sure, if you are trying to do 60fps animation, then 768 x 480 x 32bit
will eat up all the processing time, but at a more reasonable 30 fps, you
are only using half of TOM's ability. Sounds like plenty left over to me.

Exactly. Jaguar enthusiasts have got themselves so hooked on vapor that they
actually believe that a CD-Rom is available -today- for their console. Fact is,
it isnt, hasnt been announced, and probably WONT be until the middle of next
year, and by then, it will have already been left in the dust with such
marketing flops as CD-I, and the TurboGrafx-16 -- All of which "promised" , but
never delivered their products.

What the Jaguar wants, the CD32 already has. CD-Rom in every deck, full-motion
video, and a massive library of titles already available.

>------------------------------
>

CD32's have 2 megs of high-speed 32 bit RAM on them. The double-speed CDROM in
a CD32 can pull data off a disc at 300 kb per second. So, it takes a CD32

(gasp) about >6< seconds to fill the entire space of its RAM.. I dont see
where your "load time" argument has any weight.

>
> That's if the games being put on CD-ROMs can fit on a catridge. In my

CD32 games are measured in megaBYTEs, not megabits, and given some of the depth
of CD32 games ive seen, id highly doubt a silly 40 megbit (read:5 megabyte)
cartridge could hold the typical CD32 game. The best compression schemes out
there only offer about 45% compression.

>

So any Jaguar cartridge that dosent use every bit of its space is a waste as
well? The sad fact is, is that the Jaguar has no room to expand. CD32 users
have 550 megs of space to grow into.

Actually, they can get away with it.. Although its a half-truth. The CD32 has a 24-bit pallete, and can display graphics identical to true 24bit in resolutions up to slightly over 640 X 400..

Much the same was as Atari can get away with callng their Jaguar a "64 bit machine" when only a fragment of the console is true 64-bit, that being a small bus that interconnects the GPU and the display chip. The rest of the console is 16-bit, where CD32 is full 32-bit.

>GM> 64-bit wide memory).

Uhhh, heh, I dont think you understand how bus architectures work. Thats like saying:

"Well, this Cray II XMP supercomputer can emulate a Commodore 64 -- I dont see why a Commodore 64 cant emulate a Cray"

Think of the term "32 bit wide bus" as a sewer pipe.. its 32 feet wide.. It can handle the traffic of a 16-bit (or 16-foot wide) water supply going through it.

Now on the other hand, lets say you have a 16bit (16 foot wide) sewer pipe.. It cant handle the amount of water(data) a 32-bit pipe carries..

A 16-bit CPU can only address 16-bit memory, at maximum.. It can address 8 bit memory, 16-bit memory, but NOT 32-bit memory.

In otherwords, your Jaguar dosent have 64-bit memory, because if it did, there would be no way for the CPU to access it! :) Also, the fact that 64-bit-wide RAM chips go for $450-$600 PER MEGABYTE in eletronics catalogs, may make you scratch your head. The Jag has 16-bit memory.

>
>Error .. the memory in the Falcon is 32bit.

The Falcon has an 030(32-bit) chip that sits on a 16-bit bus. Its memory, therefore, is 16-bit.

>
>(The datapath may be 16, but the memory is 32, and is used as such by all the

Well of COURSE its going to be easy. HAM6=4096 colors from a pallete of 4096.
HAM8, however, is a different story, because it has a 16.7 million color
pallete, and often more colors available than there are pixels on screen --
identical to 24-bit graphics.

Bahahaha, boy, you really impress me. By the way, I JPEG images virtually daily, and I can tell you for a fact that youre completely and utterly WRONG.

This guy here expects me to believe that by some miracle of modern technology, Atari has come up with a way to put 50 megabytes of data on a cartrige--Suddenly, every computer maker in the world will scratch their heads and say "duh! well what are we putting ram chips in our computers anymore! lets use Jaguar cartridges!"

Get a fucking clue, pal. RAM expansion cards for modern PCs (INCLUDING your Falcon) are the size of shoeboxes for a reason.

Hell, a friend of mine installed a 16-megabyte RAM expansion board on the $20,000 Sun Workstation he uses at work, and the board was the size of a shoebox. And you expect me to believe that Atari can put 4x as much data on a cartridge?! If a Jaguar cartridge held that much memory, your Jaguar would need a power supply the size of a VCR, and the cartridge would more than likely MELT from the heat generated, you IDIOT!

I have only two things to say to you.

1) Get a clue, take a class, read a BOOK for gods sake.

2) Wh.hehheh..WhoHHEHEHAHAHAHAHAHAHAHAHAHAAAAA!!! 50 MEGABYTES?! Hello! Hello! Earth to Idiot, this is Reality speaking..

Try >>> 50 MEGABITS <<< , or the equivalent of 8 megabytes. Whoopdeedoo.

A whopping 1/70th the space offered by one CD32 cdrom.

Nonsense. You obviously haven't the foggiest idea of how the HAM modes
really work.

A true 24 bit/pixel (bpp) display allows any pixel on the screen to
be any of 16 million (or so) colors. This is the value of a 24 bpp
display - you don't have color limitations for any pixel. This is not
true for HAM modes (HAM8 included) as there are interpixel color
dependencies. The color of many (most?) pixels on the screen must be
related to the preceding pixel - that's simply the way the hardware works.
Now HAM8 has its strengths, particularly for animation, but don't equate
it to a true 24 bpp display mode.

> Hope that clears things up.

Hardly.

- Dale Adams

Unless you make the water flow twice as fast on the 16 foot pipe
section, and have an interface that "funnels" the 32-foot wide area
into the 16-foot wide area... Actually it's called Bernouilli's
equation of fluid dynamics. Your analogy has just proven you wrong.

> The Falcon has an 030(32-bit) chip that sits on a 16-bit bus.
> Its memory, therefore, is 16-bit.

Nope. It has a 16 bit CPU <--> memory bus. It has a 32 bit bus to
everywhere else in the system... Maybe you want to call it 24-bit
memory, because one set of chips access it at 32 bit sizes, and the
CPU accesses it as 16 bit... Sheesh!

GM> By the way, are you for real? I hope you realize that your actions
GM> are having the opposite effect. Because of you, I'm sure a lot of
GM> people won't even consider a CD32 now...

Now this I can believe...

Simon.

>machine" when only a fragment of the console is true 64-bit, that being a small
>bus that interconnects the GPU and the display chip. The rest of the console is
>16-bit, where CD32 is full 32-bit.

Uhm.. I guess the CD32 must be 4 bits then.... Because the memorychips only is
4 bits wide... Or maybe it is 8 bits, because the CIA-chips is 8 bits!?! DUH!

[stuff deleted]

I don't bash the CD32, it's a great machine, but counted in performance the
3DO & Jaguar leaves it behind in the dust. What's speaking for the CD32 is that
it has more titles and more coming, but I fear that the CD32 will die because
of piracy. This is a fact, since I *know* that all the available titles for
the CD32 is already pirated and are available on so called elite/warez BBS's.

Btw, why do insist calling the ChipRAM on the CD32 for "highspeed"?? It's just
ordinary RAM... The CD32 has exactly the same hardware as the A1200, except
that it got a CDROM and the Akiko chip for chunky<->planar pixel conversion.

>>GM> 64-bit wide memory).

Well - that's fair enough, although I don't think that's the idea in the Jaguar's architecture - the 68000 tell's the custom chips what to do & they then do the majority of the memory accessing themselves @ 64 bits.

>
>Uhhh, heh, I dont think you understand how bus architectures work. Thats like

>

Now - let me take you by a the hand and lead you into the promised land of understanding.

Let's first seperate two area's - address & data bus (as you seem to have confused the two). The address bus width limits the amount of memory you can access. The address bus width limits the amount of it you can access at one go.

So. A 64 bit data bus allows you to access 8 consecutice Bytes of information at one go. (eg locations 0-->7).

A 16 bit data bus (as in a 68000) only allows you to access 2 consecutive bytes at once. (eg locations 0--7).

If we assume a common address bus between all the chips, then although both chips can access the memory (which is stored in 8 banks each 8bits wide), but the 16 bit chip will require 4 times as long to access the same data.

>In otherwords, your Jaguar dosent have 64-bit memory, because if it did, there
>would be no way for the CPU to access it! :) Also, the fact that 64-bit-wide
>RAM chips go for $450-$600 PER MEGABYTE in eletronics catalogs, may make you
>scratch your head. The Jag has 16-bit memory.

Several parallel banks of 8 Bit memory (just like all PC's use to get 32 Bit memory access) will give you 64 bit memory as 64 consecutive bits may be accessed at once. The idea of using 64bit wide memory chips is nice, but it just isn't how these things are done. You obviously have no experience in the field or you would have kept quiet about this....snigger.

>>
>>Error .. the memory in the Falcon is 32bit.
>
>The Falcon has an 030(32-bit) chip that sits on a 16-bit bus. Its memory,

Wrong again. The Falcon has a 16 bit processor --> memory bus, but has
32 bit Custom chip (sound, etc) ---> memory bus => memory is 32Bit.

>>

Uhm... Did you know for a fact that the memorychips in your Amiga is either
4 bits wide or 1 bit wide depending on the configuration? Uhm.. That means that
your Amiga can't have a 32 bit CPU then!?!

If I where you (which I luckily am not!) I would read some CS before posting
anything more.

>>
>>Error .. the memory in the Falcon is 32bit.

>The Falcon has an 030(32-bit) chip that sits on a 16-bit bus. Its memory,

Nope the memory in the Falcon is 32 bit.. The 68030 can handle 8, 16 or 32 bits wide busses without problem, and the datapath to the 030 is 16 bit (Yes, I know, it's moronic but it's also a fact)

>>
>>(The datapath may be 16, but the memory is 32, and is used as such by all the

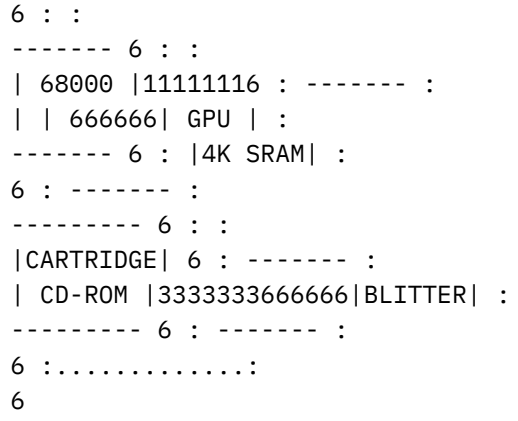
> RAM chips go for $450-$600 PER MEGABYTE in eletronics catalogs, may make you
> scratch your head. The Jag has 16-bit memory.
You are wrong.
You are horribly wrong.
You are so wrong like only an asshole can get wrong.
You are even more wrong than that!

Let's have some grafix:
----------

Here's an ASCII version of the block diagram posted with aeo_se_j.zip to
atari.archive.

1 = 16 bit bus
3 = 32 bit bus
6 = 64 bit bus

```
....JERRY.......... BUS
: : 6
: ------- : 6 ....TOM........
: ----- | DSP | : 6 : :
sound <------|SOUND|| + |3333336 : ---- : ------
: ----- |8K SRAM| : 6 : |DRAM| : | |
: ------- : 666666|MEM |6666666666| DRAM |
: |TIMERS | : 6 : |CTRL| : | |
: |UART | : 6 : ---- : ------
joystick <------------>|JSTICKS| : 6 : --------- :
: |CLOCKS | : 6 : |OBJECT |--------> to video
: ------- : 666666|PROCESSOR| :
:.................: 6 : --------- :
```



There are datalines D0 to D63.
Look, the 68000 is in fact connected to the datalines D0 to D15. Now how can
it get to the data coming over the lines D16 to D31 ???
Look again at the grafix. The 68000 is NOT connected to the DRAM! It is
connected to the DRAMcontroller. Now, when the 68000 requests the word
at adress $0001202 which is contained in the bits 16 to 31 of the 64bitRAM the
DRAMcontroller does the following: it reads the 64bitLong at adress $00001200
into an internal buffer. Then with the 3 lower bits of the 68000's adress the
DRAMcontroller knows what part of that internal buffer has to be mapped to
the datalines D0 to D15. The lower 3 bits say: $2. This is obviously the
second word.
Result: D16-D31 of DRAM is output to D0-D15 of the 64bitBUS.
For every word that the 68000 reads, an entire 64bitLong is read from the DRAM.

But if Atari has done the cabling a bit intelligently, the DRAM controller can
directly read the 16bitWord requested by the 68000 wrom the 16 corresponding
RAM chips.
Oh you didn't know that each of the 64 ramchips stores 1 bit. Sorry for you
but then you should not discuss about thing you dont know, don't understand
and you will NEVER understand with your tiny brain.

> >Error .. the memory in the Falcon is 32bit.
>
> The Falcon has an 030(32-bit) chip that sits on a 16-bit bus. Its memory,
> therefore, is 16-bit.
Like above the 68030 talks to the COMBEL which has on one side the 16bitBUS
for the CPU and the 32bitBUS of the DRAM. Same trick.

Georges.

Drain yourself down the toilet!

Until proven different, a cartridge uses ROM and not RAM. ROM is much cheaper
and takes less place than RAM.
ROMs do not produce heat!
The Falcon's ROM (256KB) is very small. 2x2 cm exactly. It's on one chip.
And I'm shure this is NOT the highest capacity miniROM you can get.
And concerning this 16Mbyte shoebox expansion is total crap. The only shoebox
expansion I saw had an total of 256 MEGABYTES and it's from GE-soft and was
used in a TT.

Fucking hell of greetings,
Georges.

Yeah, but its kinda hard to make electrons flow through copper wire at twice
the speed they normally do, now isnt it? Sit down.

}
} Yeah, but its kinda hard to make electrons flow through copper wire at twice
} the speed they normally do, now isnt it? Sit down.

You have to be doing this on purpose.

The rate at which the bus runs is the clock rate. It has nothing to do with the speed of electrons through copper, which is orders of magnitude of m/s faster than 16 million... Can you not see the possibility of having a 16MHz clock rate at the chip, being driven off chip via a 32-bit bus, and converted via a multiplexer into 2 16-bit signals, then de-multiplexing at the other end. Run your intermediate bus at 32MHz, and the '030 will never know the difference.

Ye Gods, I thought you'd understood that. I don't have to s p e l l t h i n g s o u t so much to my little sister (aged 12).

Simon

Well CD32 idiots - read this -

What was that stupid thing that Commodore released a couple of years ago - CD-I? Well, that baby STAYED ON THE SHELVES, I don't know of any places that actually sold one, and CD-32, being very similar, may well go the same way. If I was going to buy a console at the moment, I would buy a MEGA-CD, as the Jag is not out ....
But it is coming - hey if Atari Oz think it's coming, it must be due here next week .....

Karl.

: Can you guess what takes space in consolegames? Right, graphics .... can you
: compress graphics with Jpeg?

: YES!

That's okay if you want to put up with lossy compression. Though, it
should be okay using a 24bit graphics representation, though most of
them still gobble up a 256K of hard-drive space when compressed.

: That's how you'll reach the 50 MEGABYTE figure .. (more than any CD32 game
: out!)

Well, uncompressed, some of these images will take about 2Megabytes,
(assuming highest resolution at 24 bits) and 25 of these and there
goes you 50 megabytes.

I'm sure you know of many Jaguar games that have 50Megabytes of
graphics. What happened to the code?

- Jim

PS. I'm hanging onto my money until all the games for these new
consoles start flowing in. I'll think I'd get myself a CD-ROM
player to share between my 486 and Amiga.

:-) Hardly to believe. Here in Europe the music industry tries to raise the
CD prices from ~30 DM to ~50 DM, even though CDs are cheaper to produce than
LPs.

Well, I HAVE seen an played the CD^32 at one of the major department shops
in Munich meanwhile (Karstadt, to be precise). The graphics look quite
good (I played 'Oscar') but the game pad is the worst I ever used.

Those are statements by Mr.Donley, 'Amiga expert'. Could some of the REAL experts please tell him something about how graphics boards work (chunky modes) and what monitors and/or TV sets are able to display (PAL resolution, NTSC resolution, 14" monitor limit, etc.)? I mean, he seems to post his claims to c.s.atari.advocacy and not to c.s.amiga.advocacy (CD^32) because he feels his statements are ridiculous.

The bandwith of the A1200 is approx 25 megs/second, this means FULL bus
contention (e.g. in 640*480*256 colours + overscan).
Thus, games are not possible in resolutions that high, they usually will
make use of the 320*200*256 mode.

: > means that
: > a 24-bit image and a HAM8 image are IDENTICAL, up until (roughly) 640 X
: > 400.

: Nonsense. You obviously haven't the foggiest idea of how the HAM modes
: really work.

: A true 24 bit/pixel (bpp) display allows any pixel on the screen to
: be any of 16 million (or so) colors. This is the value of a 24 bpp
: display - you don't have color limitations for any pixel. This is not
: true for HAM modes (HAM8 included) as there are interpixel color
: dependencies. The color of many (most?) pixels on the screen must be
: related to the preceding pixel - that's simply the way the hardware works.
: Now HAM8 has its strengths, particularly for animation, but don't equate
: it to a true 24 bpp display mode.

I own an Amiga 1200. The HAM8 fringing is barely noticeable. *But* you
can only have 262,144 colors on a HAM8 screen. Well, you _could_ have more,
but in all the nice color fades, the steps would nearly all be 18-bit. So,
for a picture with many different colors, HAM8 is perfect. For a picture
with many different shades of the same color, 256-color mode is much better.
Anyway, you have a choice. (Btw, you have 64 base colors from which to choose
in HAM8, apart from the red/green/blue component alterations. Those pixels
using the base colors are not dependent on the previous pixel). Anyway, I
don't think you would run a game on a Jag in 24-bit mode. It would take a
hell of a memory bandwidth for that, both for the display and for blitting
around the objects. It's nice for pictures, though - but so is HAM8.

(For all of you who don't know, if you set a component, only the top 6 bits
are affected. The lower two are left intact. So by carefully setting up the
palette, you can have a different color on every pixel on the screen in any
screen resolution, up to 1400x600 50Hz-interlace, or 800x600 72Hz-interlace.)

Regards, Kristofer.

That's nice... I thought that Amiga was made by Commodore, right? :) Btw,
do you really think that they made a new chip set for the CD^32? I don't.
Another point, burst-mode access on an MC68EC020? Really!!? Wow, time I
made it work on my A1200! I've seen a CD^32 in action. I have only heard
vague rumours of the Jaguar. Seeing is believing.

Have fun, Kristofer.

Take it easy... We both know that it's not the electrons that move - it's the electric field. The issue is, that it seems kind of stupid to have two 32-bit devices connected with a 16-bit bus. What's the point with that, Falcon advocates? Btw, could you _prove_ that the 16-bit buffer between processor and memory is clocked at double speed? If so, I'm satisfied.

>publications.

Actually, C= are advertising the CD32 on TV in the UK. Mind you,
the advert is CRAP ;-)

There is still no UK/Europe release of the Jaguar yet, although I
have seen reviews of preproduction models in the uk `Edge` magazine,
and also some video footage on the Sky TV `Games World` programme. I
agree with the commentary in `Edge`, its a nice looking machine
specs wise but so far the software is pretty crap. The one thing
which did look really good was the `Aliens vs Predator` game which
looks to have amazing graphics. Really, the biggest problem that
will be faced by the jaguar is that Atari are (mis)marketting it.
Just look how they screwed up the Lynx. With the might of Sega and
Nintendo I think that it will most probably be wiped out by clever
advertising by the big two.

Incidentaly, the CD32 has sold 65000 units in the first 6 weeks
of release in the UK alone - and thats with limited stocks available
and before the ad campaign. The expect to sell a total of 200000 in
the UK over the christmas period.

>only 10 Meg A1200 conversions available) and they earned NOTHING selling them
>.. (IF they will sell one - they haven't YET!)

I think you`ll find that most forthcoming Amiga games will also
be released on CD32 Although maybe not proper CD product, they will
deliver a large base of good software for the machine whilst the
true CD titles are being developed. Take a look at `Microcosm` for
the CD32 to see what sort of things you can do with specially
developed CD software.

As regards sales, in the UK Amiga software runs a close second to
Sega megadrive software. ST sales are at the bottom of the list - at
the same level as the C64! No wonder theres not much support for it
anymore.

If you want the Jaguar to be successful, there will have to be a
LOT of good software for it. I really doubt that will happen, but it
can only be good news for gamesplayers if it does. Not that its
going to have any positive impact on the Atari computer line. If it`s
a sucess, Atari will concentrate on the Jaguar. If not, Atari go
down. Either way, the most probable future for Falcon software
developement is slow starvation.

>Can you please give us a source for the above lie?

I don`t know about half a million , but as i previously posted CU
Amiga are reporting 65000 in the first 6 weeks in the UK alone. Lets
not forget that with 120000 AGA Amigas in the UK also, thats a total
of nearly 200000 machines already that you can make the software
for. After the Xmas period, we can expect over 500000 AGA capable
Amigas in the UK. As I said in the previous post, Amiga software is
the second most popular seller - only just behind Sega megadrive, so
there is plenty of development.

PLUS: The compatibility with older Amigas makes hundreds of
excellent standard ECS 16-bit titles available too.

THATS why I can run Frontier, Hired Guns, Alien Breed 2 AGA, Mortal
Kombat, Desert Strike, TFX, Space Hulk, Wing Commander, Stardust
etc. on my Amiga and you can run diddly squat on your Falcon. Unless
we see a remarkable improvement in Atari marketting then
unfortunately this is the same fate of the Jaguar.

>CB> The show

I saw an article in a UK Sega Mega CD mag which looked at the
Jaguar. They concluded, as above - Nice specs but crap games (so
far). Face it, software sells machines. Thats why my Atari Lynx has
sold so little and the awful Nintendo gameboy has sold so much.

I hope not. 3DO has the advantages of both CD storage and advanced
processing hardware. It really looks like it could bring a new
generation of games far in advance of ANY machine currently
available. I dont see it taking on the Mega-CD or CD32 directly, but
it would be nice to have a `high end` CD games system available.

>sells as well!

Hey, even existing 16-bit Amiga games far outpace anything seen on the Falcon. Look at Stardust or Project X or Hired Guns or Alien Breed `92 edition. The A1200 games just starting to emerge are looking pretty awesome so having `just 1200 games` available will be a hell of a boost for the CD32 (Being able to sell for the A1200 as well gives them a much bigger market).

When the Jaguar is released, Atari would be very grateful to have anything even approaching the sort of support that will be available to the Amiga/CD32.

The Jaguar COULD produce awesome games but will it last long enough for anyone to make half decent software which uses its full capabilities? Looking at the Lynx and Falcon I have to say that I severly doubt it.

BTW Are there ANY games for the Falcon? I hear it won`t run ST games (no great loss, but at least there would`ve been some software for Falcon owners to run, and a good reason for ST owners to upgrade).

>The CD32 has almost NO TITLES at all available .. I just talked to a salesman
>here, and he said that if Commodore believes the CD32 to be a good machine
>they've obviosuly got some serious brain-malfunctions ..

Actually the CD32 already has 20 titles specifically for it (I got
that from the UK Special Reserve computer club magazine). It can
also run about 40 CDTV disks (some are actually OK). So far, there
is virtually nothing that really uses the CDROM apart from the
graphically stunning `Microcosm` from Psygnosis. There will most
likely be a wait for a few months til` we see true CD32 games which
make use of all aspects, but right now there are enough available to
make the machine worth getting.

>The CD32 is CRAP, costs TOO MUCH and it has NO GAMES! (All the games available
>are A1200 games not using the CD storage! LAME!)

Strange, apart from the CRAP bit, you could almost be listing the
reasons why the Jaguar will most probably fail. Even with a Jaguar
CD unit, how many games will utilise it as its not standard??

Hear hear! Thats what it boils down to Atari fans. Software
availability, user base and cost.

SO that falcon has 16-bit sound and DSP - SO WHAT? I`m playing Hired
Guns, Cannon Fodder (demo version) and `The Settlers (demo version)`
and the sound is just AWESOME - even though it is only 8-bit with no
DSP. The Fact is that I can get this software for my A1200 and you
can`t for the Falcon. 16-bit sound/No software or 8 bit sound/LOTS
of software. Which do YOU think is going to be more attractive to
the potential buyer?????

Do you think Its gonna be different with the consoles. Will kids
say bye-bye to Sega with Aladdin, Sonic etc just to get some
whizz-bang Jaguar with virtually NO decent software for it?

Tune into `Sanity FM` Atari advocates!

>buy a CD^32? Remember that C= themselves asked the games companies to make
>their CD games compatible with ALL AGA machines (including the 4000/040).

I can only speak for myself but as an A1200 owner I WON`t be
buying a CD32.
I WILL be buying the CD Drive add-on to give compatibility
though, as I suspect will be many of the 120000 plus UK A1200
owners.

I think a lot of owners of older 16-bit A500/A500+/A600 machines
will probably buy a CD32 as an upgrade, and bolt on the keyboard and
floppy drive later. (There are 1.5 MILLION 16-bit Amigas in the UK
alone)

Gavan (via a friends account)

>a game to really max out all of that added storage on the CD-32 until
>there are CD-32 units selling in huge quantities?

Hey, the whole point is that the CD32 can rely on a variety of
excellent existing Amiga titles and still sell whilst the true CD
titles are being developed.

Look at Ataris last commercial `fight` - the Falcon vs the A1200.

Both were supposed to be 32-bit home computers to take over from
the 16 bits lines (the ST and A500).

The Falcon was completely INcompatible with the old ST games.
The A1200 could run approx 70% of the old A500 stuff.

The Falcon today has NO games and is selling very poorly.
The A1200 has sold well since launch, because you can run old
Amiga stuff on it and people are prepared to wait whilst the 32-bit
stuff is in the pipeline. Its only now that A1200 specific titles
are coming out in force.

Now tell me that the Jaguar is going to sell millions and the
CD32 will bomb. I hope they both will do well but I suspect that the
`advanced capabilties` of the Jaguar will come to nothing in the
face of lack of software.

`Hey, Betamax is so much better than the competion it`s sure to be
a big success` - Sony before Betamax flopped

`Hey, the Lynx is so much better than the competion it`s sure to be
a big success` - Atari before the Lynx flopped

`Hey, the Falcon is so much better than the competion it`s sure to be
a big success` - Atari before the Falcon flopped

`Hey, the Jaguar is so much better than the competion it`s sure to be
a big success` - Atari today.....

> 4096.
> HAM8, however, is a different story, because it has a 16.7 million color
> pallete, and often more colors available than there are pixels on screen
> -- identical to 24-bit graphics.

Again, you obviously don't know how the HAM modes really work. HAM8 is not the same as true 24 bit/pixel video. Any pixel on a HAM8 screen cannot be any of 16 million colors, let alone any of the 262144 colors you claim for HAM8. The color of most pixels on a HAM8 screen is dependent on the color of the previous pixel (unless you want to limit yourself to 64 colors). This does produce a color fringing effect. Now, as to whether it's noticeable or not on all images is another issue. It certainly is on most HAM images I've seen, although it's not on many HAM8 images. Regardless, HAM8 is not "identical" to true 24-bit video (although it's certainly faster for animation uses - less data to move around).

>CD> that
>CD> last staement back and slap yourself if you actually PLAYED an A1200 game.
>CD> Guess you havent.

>Nope, I've been playing SNES games .. I don't wanna GO BACK!

You have to play SNES games Rickard, as there simply aren`t any
for your beloved Falcon. As an Amiga owner I can enjoy the benefits
of a nice 32-bit machine with multi-tasking o/s AS WELL AS all the
top computer games.

Unfortunately, I wouldn`t sell the SNES when the Jag comes out
as you may well need to keep it if you want games software....

>MPEG module READY for the CD32? Where can I buy it?

Silica shop are advertising it for 199 UKP. It does exist as its
been demo`d at shows and seen by the Amiga press. It should be in
the shops around now.

BTW: I also note that Silica sell 1 meg/no HD Falcons at 499 UKP.
I`ve also seen Ladbroke sell the same configuration of Falcon, so
please stop your `All Falcons are 4Mb/65 Meg HD at least` crap. The
BASE Falcon is actually lower spec than the BASE amiga 1200 for what
its worth.

>Sure ... I live in Sweden - the CD32 doesn't sell at all here.

Why do Atari owners feel such a fear of the CD32??
They seem to need to slag it at every oppotunity. Do they see it
doing the same to the Jaguar as the A1200 did to the Falcon??

I wouldnt worry, its SEGA and NINTENDO that will give the jaguar
a good going over. (oh, and Ataris incompetance at marketting)

>>pallete of 16.7 million.
>>
>>Jag loses. Neeext...

>You're the only loser here. And your CD32.

Look, Atari advocates. WHEN the Jaguar is released and we can see
for ourselves then Flame the CD32. The Fact is that the CD32 is out
and is selling in numbers with a good future.

Does ***ANYONE*** who is currently advocating the Jaguar actually
OWN one, or know someone who does? Has anyone actually SEEN one in
action in *real life*?

Look at the above arguement about colours/resolution. Can anyone
definitely , absolutely confirm or deny the figures. I doubt they
can as even the dickheads feverishly advocating it don`t really know
that much about it. I realise that Atari owners are sore at the
Amiga for wiping out their beloved home computers (the ST and
Falcon) but please wait until we see some hard evidence.

For what its worth, I think the Jaguar looks MUCH better
technically than the CD32, but which one will still be around in 2
years time?

I will buy my hardware based on price, software choice and
lastly specs. Brand name (Atari/Commodore) does not come into it or
I would be owning an Atari now having previously owned an Atari VCS,
Atari 400 and 800XL. I will buy the best system based on the above
criteria and any wanker who would buy a system just because it has
the Atari or Commodore badge on it isn`t worth bothering with.

Will I buy a Jaguar - Maybe. IF it has a large amount of
excellent games for it.

Ah, you actually own a Jaguar then, or maybe have used one? The
fact is that you DON`T really know exactly what the Jaguar is
capable of. You`ve just seen specs floating around on the internet.
Maybe it does 24-bit colour, maybe 32-bit (as RT claims). Who knows?

Just how do you animate 24-bit colour pics off of ROM cart? Most
ROMs are only 3 megabytes at most and they cost a fortune in the UK.
Don`t give me that guff about `50 Meg on a cart` as it was
referrring to JPEG compressed graphics. Are you going to decompress
at 25 fps to give 24-bit animations? Moreover, you can JPEG static
pictures but program code and to a certain extent program data is
still going to have to fit within a 2 or 3 meg ROM space ceiling.

>a 24-bit image and a HAM8 image are IDENTICAL, up until (roughly) 640 X 400.

No, you`re talking Crap here Clayton. This is just the sort of
thing that RT spews out about the Falcon.

HAM8 is NOT 24-bit. It CAN provide indistinguishable (to the
human eye) quality images. In the above case, the images would be
very close but NOT identical. It would not be the same as 24-bit,
but probably good enough to fool most people.

HAM8 has only an 18-bit dynamic range, but a 24-bit palette.

Converting 24-bit to HAM8 certainly is a lossy process, but so is
doing 24 to 16. Overall, I feel that HAM8 provides the better
display medium for static pictures and animations, though 15/16 bit
would be a better mode for an artist to `paint` in.

>been doing PAL/NTSC perfectly on my Amiga for several years now.

Perhaps our feathered changeling friend is thinking in terms of monitors the way that many Macintosh users do. In striving to maintain 72dpi, the Mac community has come to associate resolution with screen size. The 9" monitors on the PortHole Macs had a resolution of 512x342 or so, the 12-14" monitors on the later Macs used 640x480, and there are now 15-16" monitors with ~800x600, 17-19" monitors with ~1024x768, etc. This is of course not necessary in all cases and there are ways to make the Macs display lower resolutions on bigger monitors, but that would violate the precious 72dpi that they hold so dear. They would probably die after seeing my 20" monitor at work displaying a 320x200 mode.

:-)

BTW, are you _the_ Bowie J. Poag? If so, I wonder how long it will be before other ghosts from the past pay us a visit...

What you're seeing is effectively anti-aliasing. Try doing some proper
work using that resolution on a TV and you're bound to get problems
distinguishing individual pixels. TV sets don't have that kind of
resolution.

>And sure, if you are trying to do 60fps animation, then 768 x 480 x 32bit
>will eat up all the processing time, but at a more reasonable 30 fps, you
>are only using half of TOM's ability. Sounds like plenty left over to me.

Plenty of time? Think again. The Jaguar uses a DRAM implementation,
so pumping out 768*480*32 bit interlace would eat up roughly half of the
alleged 100MB/s bandwidth alone. Then you'll have to copy some new data to
display, which takes twice as much time as the output does, even if you
just do a straight memory->memory copy... To be able to do that you'd need
50% more bandwidth than is available.

>> 256 colours are more than enough for most games. Coupled with the

>Sure, right... that's why everyone (except Commodore) are making machines
>with better than 8 bit graphics...

Who is `everyone'? SNES has 8-bit gfx, the SEGA has 4/6-bit graphics
(hybrid), 8-bit cels are commonly used in 3DO games. The Jaguar apparently
has 24/32-bit modes, but given the fact that it is a cartridge system,
few games will have imagery drawn in 24 bits.

I didn't catch this thread until now (haven't been reading the Atari groups lately), so I have to assume that you're still arguing about the A1200 sales. If so, I can tell you that it has sold over 300,000 units worldwide as of November 1, 1993. 150,000 of these were sold in the U.K alone. Source: Computer Trade Weekly and Commodore UK. They're selling all computers they can produce, basically.
---

Nope, we're talking about CD32 sales.

>(I'm not saying EVERY game will use it - but we talked about MAXIMUM specs!)

Yes, I know the Jaguar specifications very well, thank you. I also know
how to interpret them, which you obviously don't. Do the maths and tell me
what you come up with. Q: Is full-screen animation at 768*480*32 possible
at 30fps? Here's the answer reversed if you don't manage: !oN.

>SB> 256 colours are more than enough for most games. Coupled with the

>SB> that. You really should see some of the stuff we're working on.

>More than 640Kb RAM will never be needed .. :-))))) ... Heard that one before?
>(Hint - IBM PC)

I never uttered it, that's for sure. I didn't say that 256 colours was
optimal, but it's enough for most purposes. It's also very practical. I'm
doing a conversion of Alien Breed II for SEGA right now, and I can tell you
it's a hell to get all graphics into the cartridge, even though they only
occupy a little more than 4 bits per pixel. I use some of the most
sophisticated and efficient data compression algorithms available, but it's
still difficult to squeeze everything in. Using 24-bit graphics imagery
wouldn't exactly help.

>SB> >Where did you get the rest of your lies from?

>SB> One could ask you the same thing. You both seem to have difficulties
>SB> separating facts from fiction.

>So? Where did I lie then?

Several times. Regarding the HAM issue some weeks ago, A1200 prices,
and so on... You often state things you don't know for sure as if they
were the gospel truth.

)Exactly. Jaguar enthusiasts have got themselves so hooked on vapor that they
)actually believe that a CD-Rom is available -today- for their console. Fact is,
)it isnt, hasnt been announced, and probably WONT be until the middle of next
)year, and by then, it will have already been left in the dust with such
)marketing flops as CD-I, and the TurboGrafx-16 -- All of which "promised" , but
)never delivered their products.
)

Well, you are once again wrong. CDI may have been a flop before, but
it is probably the most potential for this christmas of any console.

As for the Jaguar CD-ROM, they do have one developed - it's been seen
by others. It would make no sense to release it with no games though,
and before the nationwide release. From what I've heard they plan to
release the Jag CD soon after the nationwide release, so it will have
CD-ROM virtually from the start.

)
)What the Jaguar wants, the CD32 already has. CD-Rom in every deck, full-motion
)video, and a massive library of titles already available.
)

The Jaguar can use Cinepak to get full motion video, at no extra cost.
I know the CD-32 will soon have MPEG availiable, but in my opinion the
MPEG disks will be a huge flop. Why would you pay $200-$300 for an
MPEG cartride to play disks that only look marginally better than VHS?
Why not just get a VCR, at least you can record stuff!! And besides,
Laserdisks still look better. So there seems to me to be NO POINT to
this MPEG movie on a disk stuff.

)
)>------------------------------
)>
)>Ok, I'll respect that...
)>
)> :#Now, let's say Donley is right, and the CD-ROM is "all that"... well,

)close!)
)> :#and have no "load time" involved.
)
)CD32's have 2 megs of high-speed 32 bit RAM on them. The double-speed CDROM in
)a CD32 can pull data off a disc at 300 kb per second. So, it takes a CD32
)(gasp) about >6< seconds to fill the entire space of its RAM.. I dont see
)where your "load time" argument has any weight.
)

Well, if all of the data can be read in once, you are correct. If you
have to do more than one seek though, you're looking at a time of 10sec+.

Here's an interesting thing I have yet to see come up - how much CD-32
OS is in RAM? The Jaguar has no OS, leaving 2MB free. the 3DO has an
800K OS. How much RAM does the CD-32 OS take up?

)>
)> That's if the games being put on CD-ROMs can fit on a catridge. In my
)> experience the majority of stuff coming out on CD-ROMs will not fit on a
)> catridge. I've seen Crash 'N Burn, nice, but I don't really go for racing
)> games. Not my type of fun, sorry.
)>------------------------------
)>
)>But the Jaguar provides a larger cartrige space and hardware
)>compression so you can stuff a lot of graphics into a cart, this
)>overcomes some of the space problem. You could probably fit any of
)>the CD-32 10mb games into a Jag cartridge.
)>
)
)CD32 games are measured in megaBYTEs, not megabits, and given some of the depth
)of CD32 games ive seen, id highly doubt a silly 40 megbit (read:5 megabyte)
)cartridge could hold the typical CD32 game. The best compression schemes out
)there only offer about 45% compression.

)

Well, if true, than yet another example of poor marketing by
commodore. When the come into the market saying MegaBytes with MB,
and *every other* games system uses megabits, then the CD-32 will look
pathetic.

You are so amazingly wrong about compression that it takes two strong
men and a horse just to read your statement. With JPEG, I can easily
reduce a 24-bit picture by a factor of 8 with almost no loss in
quality. I have a picture of a waterfall that takes up almost 4MB
uncompressed, yet has a file size of 250 k or so.

If most of a typical CD-32 game is graphics, then a cartrige could
hold it. How much of a given CD-32 game is code? I'd say at most 1
MB (and that would be pushing it!!) If you get an average of 7x
compression of graphics, that leaves you with 28MB (4MB * 7) of
graphics, larger than many (any?) current CD-32 titles.

)
)
)>
)> :#So I'm wondering... what good is this advantage until software comes
)> :#out that demands the added storage?
)> :#Price isn't a factor... the games cost as much as cart titles.
)> :#Speed is slower than a cart.
)> :#Storage... well... if it's not being used, it's a waste.
)
)So any Jaguar cartridge that dosent use every bit of its space is a waste as
)well? The sad fact is, is that the Jaguar has no room to expand. CD32 users
)have 550 megs of space to grow into.
)

Well, with a cartridge, there is no waste, you moron!!! You put in as
much ROM as you need.

I'd say it is definatey a waste to put a 10MB game on CD-ROM, if I get
a CD-ROM then the games had better pack the damn CD full to the gills
- I wan't what I'm paying for!! If all you get is 10MB CD-32 games,
then the CD-ROM drive is USELESS.

<a few hundred lines of wasted quotes from Clay's post deleted>

)>The only thing I question is how the CD-32's colors will be presented
)>to the public, since they can't really say 24-bit color, and the truth
)>is too confusing for most consumers. I guess ity doesn't matter that
)>much, they can just call it a 32-bit machine.
)>
)
)Actually, they can get away with it.. Although its a half-truth. The CD32 has a
)24-bit pallete, and can display graphics identical to true 24bit in resolutions
)up to slightly over 640 X 400..
)

)Much the same was as Atari can get away with callng their Jaguar a "64 bit
)machine" when only a fragment of the console is true 64-bit, that being a small
)bus that interconnects the GPU and the display chip. The rest of the console is
)16-bit, where CD32 is full 32-bit.
)

Surprise!! You're wrong again. All of the chips are connected to the
64-bit bus. The sound chip is 32 bit, the cartridge port is 32 bit,
the only rthing that's 16 bit is the 68000 and the pathway from your
brain to your mouth.

)>
)>Oh, well, but I am still getting Jaguar.....hhhhhhh
)>
)
)
)
)Hate to say "I toldja so" , but.... You people have fallen to hard for Atari's
)marketing propoganda. If your Jaguar really WAS all of the "64 bit game
)console" Atari pushed it as, you wouldnt see depressing posts like this, now,
)would you?
)

Sure, some people are never satisfied. I personally think that
Cybermorph and Raiden look fun to play, as well as being graphically
impressive (Cybermorph moves more Gourad shaded (not constant shading,
Clay) polygons in a second than the CD-32 can in a month.

Cresent Galaxy looks really impressive, but I don't like that kind of game.

Also, at least the Jaguar is being advertised on TV. Where are the
CD-32 ads? Answer: There are none!!

)>GM> wide memory (as in the Falcon and Mac LC II), then it should be
)>GM> possible to do the opposite (i.e. allow a 16-bit 68000 to talk to
)>GM> 64-bit wide memory).
)
)Uhhh, heh, I dont think you understand how bus architectures work. Thats like
)saying:
)
)"Well, this Cray II XMP supercomputer can emulate a Commodore 64 -- I dont see
)why a Commodore 64 cant emulate a Cray"
)

You fool!! I think Rickard in a comp-sci major like myself, and he has
more knowlede of a BUS than you could ever hope to aattain. You seem
to have goot all of your BUS experience by riding them rather than
studying computers than have a bus in them...

)Think of the term "32 bit wide bus" as a sewer pipe.. its 32 feet wide.. It can
)handle the traffic of a 16-bit (or 16-foot wide) water supply going through it.
)
)Now on the other hand, lets say you have a 16bit (16 foot wide) sewer pipe.. It
)cant handle the amount of water(data) a 32-bit pipe carries..
)

Your analagy works well so far, undoubtedly due to your expertise with
sewer pipes.

)
)A 16-bit CPU can only address 16-bit memory, at maximum.. It can address 8 bit
)memory, 16-bit memory, but NOT 32-bit memory.
)

What a moron. I can think of many different ways to arrange such a
systen. To simplifiy to a level you'll understand, let me use a
simple memory model in expanation.

Suppose we have something stored in memory at location zero. In a
64-bit chip, we just say: Give e the thing at location 0. In a 16 bit
chip, to get the same thing, we would say: Give me the thing at 0, at

16, at 32, at 48. See? We can access all of memory!!

)In otherwords, your Jaguar dosent have 64-bit memory, because if it did, there
)would be no way for the CPU to access it! :) Also, the fact that 64-bit-wide
)RAM chips go for $450-$600 PER MEGABYTE in eletronics catalogs, may make you
)scratch your head. The Jag has 16-bit memory.
)

You don't have to use 64-bit memory. You could use 16-bit or 32-bit
memory on a 64-bit bus if you wanted to. Memory design is not tied to
the bus like you seem to think.

)
)>
)>Error .. the memory in the Falcon is 32bit.
)
)The Falcon has an 030(32-bit) chip that sits on a 16-bit bus. Its memory,
)therefore, is 16-bit.
)
)

Well, you are wrong again (is there an echo in here?) The Falcon has
32-bit memory. The 68030 accesses it 16-bits at a time. All of the
Falcon's coprocessors (DSP, DMA, Blitter) access this memory 32-bits
at a time.

)
)>
)>(The datapath may be 16, but the memory is 32, and is used as such by all the
)>other chips)
)
)Nope. Sorry, 16.
)

Nope, sorry, 32.

)>
)>GM> By the way, are you for real? I hope you realize that your actions
)>GM> are having the opposite effect. Because of you, I'm sure a lot of
)>GM> people won't even consider a CD32 now...
)>
)
)

No reply. Actually, I had thought about the CD-32 before, but you
have definately driven me far away from one, if only for the reason
that I don't want to own anything that you think has a good design!!

): Yeah, but its kinda hard to make electrons flow through copper wire at twice
): the speed they normally do, now isnt it? Sit down.
)
)Take it easy... We both know that it's not the electrons that move - it's the
)electric field. The issue is, that it seems kind of stupid to have two 32-bit
)devices connected with a 16-bit bus. What's the point with that, Falcon
)advocates? Btw, could you _prove_ that the 16-bit buffer between processor
)and memory is clocked at double speed? If so, I'm satisfied.
)

No we can't prove this about the Falcon yet, but we aren't talking
about the Falcon, we are talking about the ability to move data over a
bus to an arbitrailty large device on either end. The Claymeisters
reasoning would lead one to belive that a 16MHz bus moves as much
data as a 32MHz bus...

Source record: 20279

In article <9311261322.AA01566@bot32> p9150919@athmail1.causeway.qub.ac.uk (John Terence Kennedy) writes:

) rickard_troedsson@troed.ct.se (Rickard Troedsson) writes..
)
)>Yeah .. I went to the local videogames store .. sure they had a Cd32 .. at 4000
)>SEK (The Jag will be around 2500 SEK btw), they had NO good games (there are
)>only 10 Meg A1200 conversions available) and they earned NOTHING selling them
)>.. (IF they will sell one - they haven't YET!)
)
) I think you`ll find that most forthcoming Amiga games will also
)be released on CD32 Although maybe not proper CD product, they will
)deliver a large base of good software for the machine whilst the
)true CD titles are being developed. Take a look at `Microcosm` for
)the CD32 to see what sort of things you can do with specially
)developed CD software.

Great, lots of old software, just what I wanted in a game system.

)
) As regards sales, in the UK Amiga software runs a close second to
)Sega megadrive software. ST sales are at the bottom of the list - at
)the same level as the C64! No wonder theres not much support for it
)anymore.
)
) If you want the Jaguar to be successful, there will have to be a
)LOT of good software for it. I really doubt that will happen, but it
)can only be good news for gamesplayers if it does. Not that its
)going to have any positive impact on the Atari computer line. If it`s
)a sucess, Atari will concentrate on the Jaguar. If not, Atari go
)down. Either way, the most probable future for Falcon software
)developement is slow starvation.
)

Why can't they use some of the Jaguar money to work on the computer line? They seem to like the computer business for some reason, and they have even said that they would do this. If the CD-32 does well, does it mean that Commodore will spend all of the time working up CD-32 stuff? no way.

Also, they biously used up resources developing the Jaguar, but now that it's out, they don't have to spend R&D money anymore.

)
)
) Look, Atari advocates. WHEN the Jaguar is released and we can see
)for ourselves then Flame the CD32. The Fact is that the CD32 is out
)and is selling in numbers with a good future.
)
) Does ***ANYONE*** who is currently advocating the Jaguar actually
)OWN one, or know someone who does? Has anyone actually SEEN one in
)action in *real life*?
)

The Jaguar is out now, a number of people on rec.games.video.misc have them, mine is coming in the mail.

) Look at the above arguement about colours/resolution. Can anyone
)definitely , absolutely confirm or deny the figures. I doubt they
)can as even the dickheads feverishly advocating it don`t really know
)that much about it. I realise that Atari owners are sore at the
)Amiga for wiping out their beloved home computers (the ST and
)Falcon) but please wait until we see some hard evidence.
)

Although you Amiga fanatics like to belive you have wiped out the ST, you are wrong - I still own one.

The full specs have been availiable for quite some time, ye of little knowledge. I have seen to Jaguar running in TV spots, and its claims are realistic. It is not some kind of weenie system like the CD-32.

) For what its worth, I think the Jaguar looks MUCH better
)technically than the CD32, but which one will still be around in 2
)years time?
)

Both will.

) I will buy my hardware based on price, software choice and
)lastly specs. Brand name (Atari/Commodore) does not come into it or
)I would be owning an Atari now having previously owned an Atari VCS,
)Atari 400 and 800XL. I will buy the best system based on the above
)criteria and any wanker who would buy a system just because it has
)the Atari or Commodore badge on it isn`t worth bothering with.
)

I buy my systems for the same reason, that's why I'm getting a Jaguar. They have a lot of big developers, plus more on the way. The price is on the same level as a CD-32 (actually cheaper, but then I plan to get a JAG CD eventually). All in all, I can't see any problems goinmg with a Jaguar.

)leigh@twain.ucs.umass.edu (Leigh A. Knowlton) writes....
)
)>Yes, the Jaguar CAN animate in 24-bit color. And it can do it a hell of a lot
)>better than your wimpy CD32 since the CD32 doesn't even have 24-bit color.
)>BWAHAHAHAHA.
)
) Ah, you actually own a Jaguar then, or maybe have used one? The
)fact is that you DON`T really know exactly what the Jaguar is
)capable of. You`ve just seen specs floating around on the internet.
)Maybe it does 24-bit colour, maybe 32-bit (as RT claims). Who knows?
)
) Just how do you animate 24-bit colour pics off of ROM cart? Most
)ROMs are only 3 megabytes at most and they cost a fortune in the UK.
)Don`t give me that guff about `50 Meg on a cart` as it was
)referrring to JPEG compressed graphics. Are you going to decompress
)at 25 fps to give 24-bit animations? Moreover, you can JPEG static
)pictures but program code and to a certain extent program data is
)still going to have to fit within a 2 or 3 meg ROM space ceiling.
)

You don't animate the pics off of a cart (although you could I guess),
you load the compressed pics into memory with the built in hardware
decompression and use them from there.

The CD may hold a lot of data, but you can't get at it very quickly,
so you'll have to do the same thing anyway - making the use of
compression a valid argumnet when comparing against CD-ROM baseed
systems.

Thorsten Guenther (guenther@vati.fmi.uni-passau.de) wrote:
:#In article <CGxouo.L25@news.Hawaii.Edu> jimmy@Hawaii.Edu (Jimmy Chan) writes:
:#>:#c) For a video game, ROMs are usually better than CDs, because they
:#>:# are faster (in fact, I like the NEO*GEO of a friend more than the CD^32),
:#>:# even though the CD^32 is cheaper.
:#>
:#>Catridges are only better in the fact they are faster at access. In everything
:#>else they are worse. A CD-ROM has more storage, the more storage, the more
:#>information that can be stored.

:#Hmmm....like those PC games with Megabytes of GIFs in between :-). Sorry, but
:#I want to PLAY a game, I don't spend that much time viewing the intro.

In this newsgroup, the general attitude towards the games console is games,
which is understandable but you sometimes have to look beyond that. The
console are able to offer more than just games as anyone with a CDROM
pheripheral can attest to. Sure, I'll probably buy games that are
available on a CD but, I'll also like to have an encyclopedia, rather than
having to buy a whole hardback version. Then there are Clipart, Demos,
Utilities, such as Fred Fish's PD collection, music, video, photographs,
etc for CDROM.

:# CD-ROMs are also cheaper to produce than
:#>catridges, in quantity. Cheaper to produce means cheaper software for
:#>users.

:#:-) Hardly to believe. Here in Europe the music industry tries to raise the
:#CD prices from ~30 DM to ~50 DM, even though CDs are cheaper to produce than
:#LPs.

This is a fallout from the greed of the corporations. Over in the states,
I hardly see anymore LPs being made. Everything is coming out on CDs or
tapes. Even those ads on TV for music collections don't offer LPs anymore.

:#>Don't know what kind of shops those are in Germany but, here in the U.S.
:#>I've already seen advertisements for CD32 for sale from a mailorder firm in
:#>Canada, and another from a U.S. mailorder firm named Tenex. Just got my
:#>catalog from Tenex this weekend.

:#Well, I HAVE seen an played the CD^32 at one of the major department shops
:#in Munich meanwhile (Karstadt, to be precise). The graphics look quite
:#good (I played 'Oscar') but the game pad is the worst I ever used.

Game pads are a non-issue. Too many differing opinions on those things and
easily replaceable.

In article <2cvpep$f2h@cville-srv.wam.umd.edu> you wrote:
:#In article <CGzCsF.GI3@news.hawaii.edu>, Jimmy Chan <jimmy@Hawaii.Edu> wrote:
:#>That's if the games being put on CD-ROMs can fit on a catridge. In my
:#>experience the majority of stuff coming out on CD-ROMs will not fit on a
:#>catridge. I've seen Crash 'N Burn, nice, but I don't really go for racing
:#>games. Not my type of fun, sorry.

:#Well, what games being released for the CD-32 that are ports of A1200 games
:#can NOT fit on a few floppy disks?

What CD32 games can fit on a few floppy disks? I'm guessing that by few
you mean only 4 or 5 disks. I don't know how you plan on putting all of
the music, levels, graphics and other stuff that comes with CDROM games
onto a few disks. Dynamix, who left the Amiga game market, had a game
called Willy Beamish that took up to 12 disks. This game had nice graphics
and some decent sound but was pretty much something like a King's Quest
type of game that I don't really enjoy. Just an example of how large games
are getting now.

:#And given that the Jag's cartridges are able to hold as much as (at least)
:#4 or 5 of the A1200's double sided, double density (880k) disks, why would
:#such a game not be able to fit on a Jaguar cartridge?

Unless the catridge can hold up to 110 MegaBytes, I don't think it'll work
to well. You could have several catridges to hold that much if you want.
Your conclusion is that CD games are only about 5 MBs or so, my contention
is that this is wrong.

:#So I think the catch is... right now, the games for the CD-32 are ports
:#of A1200 games that were distributed on floppy. I've heard of 4 and 5 disk
:#games... so that's about 4MB.

Ports, do not always mean a straight conversion. In the case of CD games,
it usually has more added. So, it's beyond 4MB.

:#4MB will fit on a Jaguar cartridge... so... why make the consumer pay
:#for a CD that they don't need? Like I said, no one has charged
:#any less (yet) for a CD game than for a catridge game... except Phillips
:#CD-I, and that's an effort to move machines with cheap software.

Are catridges cheaper than CDs to make? In a small sample, yes. In a
larger sample, no.

:#>The software that's been coming out for CD32 CD-ROM disks can't be piled
:#>into a catridge without losing a lot of other things that enhances the game.
:#>Given your words, what good is the Falcon advantage if software that comes
:#>out that demands the added storage isn't available?

:#What things are you talking about that won't fit on a cartridge but
:#can fit on a CD-ROM?

Try the encyclopedia. Try hundreds of MBs of Clipart. Try movies. Stop
basing everything on games, CDs open up a whole slew of things for people
to use. Why limit yourself to games?

:#These games were originally on the Amiga 1200. So what you're saying
:#is that the "frills" that are added on make the games for CD-32
:#better than the A1200 versions?

Why not? Lots of people want "frills", music, levels, graphics, etc.

:#And what are you talking about the Falcon for? How does storage relate
:#to an Atari computer? It can use CD-ROMs, hard drives, etc. etc...
:#and comes with a high density floppy...

Opps, meant Jaguar not Falcon.

:#>I think the stages for Jaguar software development will follow along
:#>something of these lines, IMHO:
:#>For Atari to provide a catridge based system will only insure
:#>that developers will have to squeeze down the size of the code to fit on
:#>the catridge. That's going to leave the Falcon with an initial slew of
:#>catridge games that will not be showing off everything the Falcon has to
:#>give until a CD-ROM player comes out.

:#The cartridges can hold up to 40 Mb (and this could be either megabytes or
:#megawords or, at worst, megabits) of data.
:#Say it's mega"bits". That's 5MB.

How does that compare to CDROM with 110 MB?

:#That's more than 5 floppy disks for an A1200 game.
:#Now, if CD-32 games are just reissued ports of A1200 games, how many do
:#you think are going to exceed that size?

Most likely all. I don't think the developer's are that foolish. If it's
the same size as the A1200 games then CD32 owners could just hook up a disk
drive and buy the A1200 version.

:#Are they going to show off the CD-32's power?

Same as the A1200, but with more added.

:#>This also, brings into question the next phase of software development.
:#>For awhile developers will be still producing games for the Jaguar on
:#>catridges, even after the CD-ROM becomes available since the catridge based
:#>consoles will be their low-end until a larger number of CD-ROM units are
:#>sold.

:#This is an assumption. CD units for the Jaguar have already been shown in
:#final form, and I would counter your negative assumption with the positive
:#one that they have them in developer's hands already.

Well, like how many of these will be ports of the catridges? The same reasoning could be followed here.

:#In fact, Atari did state the CD unit won't ship until they have a base of
:#software for it to make it worth purchasing.

Huh????? Base of software for the Jaguar or for the CD? If it's base of software for the CD that they are talking about then why will developers make CD stuff if the CD is going to come after. If it's a base of catridge base games then same reasoning applies from previous argument, games will be ports from the catridges.

:#>Third phase, the Jaguar will be seeing many ports of catridge based games
:#>to CD-ROM disks so, it'll be facing the same thing as the A1200 -> CD32
:#>ports. Most of those CD-ROM ports will carry extra sound, levels, etc.

:#You are jumping to conclusions rather quickly. If they only have "24"
:#games to begin with, how many ports are they going to make of the original
:#24 to CD, hmmm?

Why not hold the same reasoning you hold for the A1200->CD32 ports. I'm assuming you not trying to set a double standard here. If you're going to assume most of the CD32 games will be A1200 ports, why isn't it true for Jaguar catridge games -> Jaguar CD ports?

:#Odds are equally good they will have new titles... however, you are
:#simply speculating now in an attempt to bring the Jag down to the
:#CD-32's level because the issue of A1200->CD-32 ports is damaging
:#the CD-32's reputation.

No, I'm not trying to bring anything down except to bring a little rational thinking into a hotly emotional debate. Nothing you've said as yet is proof that the same wouldn't be followed. I'm judging by what developers are doing and have been doing while you seem to think that the Jaguar will be following a whole different set of marketing ploys?

:#>Geez, that was only used as an example of what I had posted earlier about.
:#>One title doesn't mean that's all, did you want a listing of what every
:#>developer said they are planning on?

:#Sure, why not. I'd like to see the specs.

Look in some of the Amiga game magazines, as they have articles on CD32 developers and plans. Don't know if you'd call it specs though.

Kendall Helmstetter Gelner (kendall@great-gray.owlnet.rice.edu) wrote:
:#In article <CGzCsF.GI3@news.Hawaii.Edu> jimmy@Hawaii.Edu (Jimmy Chan) writes:
:#But the Jaguar provides a larger cartrige space and hardware
:#compression so you can stuff a lot of graphics into a cart, this
:#overcomes some of the space problem. You could probably fit any of
:#the CD-32 10mb games into a Jag cartridge.

Why consider the CD32 to have only 10MB games? I thought everyone here
thought that the poster who posted this doesn't know what he's talking
about. Like I've said most of these CDROM games usually have more than
just the game itself but added things.

:# The software that's been coming out for CD32 CD-ROM disks can't be piled
:# into a catridge without losing a lot of other things that enhances the game.
:# Given your words, what good is the Falcon advantage if software that comes
:# out that demands the added storage isn't available?
:#------------------------------

:#It can in a Jag cartride, as long as most of the 10MB or so is
:#graphics. A friedian slip on your part saying Falcon?

Guess you mean Freudian. Just a slip, don't know if Sigmund had anything
to do with the slip...8-). Sorry, Jaguar not Falcon.

What happens if it's more than 10MB? Isn't a Jag cartridge 5 MB? I guess
you're mean it'll fit on a 10MB with compression right? Though I don't
think any compression programs will give you a 2->1 compression ratio.
Usually, it's about 60%. I could be mistaken.

:#------------------------------
:# I think the stages for Jaguar software development will follow along
:# something of these lines, IMHO:
:# For Atari to provide a catridge based system will only insure
:# that developers will have to squeeze down the size of the code to fit on
:# the catridge. That's going to leave the Falcon with an initial slew of
:# catridge games that will not be showing off everything the Falcon has to
:# give until a CD-ROM player comes out.
:#------------------------------

:#Not code, but graphics... it's really the graphics that suffer the
:#most cutback in a cart system. I think that you can show off quite a
:#lot of what the Jaguar (you said Falcon again, tsk tsk) can do with 2
:#MB of code and 12 MB of graphics...

Yeah, slipping again. Almost forgot the Jaguar's name while I was
composing another message. Sorry, too many animals...8-).

Does any of the games coming out for the Jaguar show off the abilities of
the Jaguar? You can show off anything with probably about 1 MB maybe even
less, but what good is it if it is only a demo?

:# This also, brings into question the next phase of software development.
:# For awhile developers will be still producing games for the Jaguar on
:# catridges, even after the CD-ROM becomes available since the catridge based
:# consoles will be their low-end until a larger number of CD-ROM units are
:# sold.
:#------------------------------

:#Some games just don't need a CD-ROM. I myself anticipate games that
:#use both the cartrige and CD-ROM, if done cleverly this could really
:#enhance a game!!
:#And I think that a number of ports like 7th guest and Dracula will be
:#out soon after the CD release anyway. You can play these until truly
:#original Jag CD games later.

I'll agree some things don't need a CDROM, hell look at Tetris. But, to
get the games I'd like, it would need a CDROM...8-). But, you see, until
the CD release stuff like Dracula and 7th Quest won't be coming out. Even
CD stuff for the Jaguar which will utilize the Jaguar will take more time
now, since it isn't released with the Jaguar.

Are you anticipating games that will utilize both the catridge and CDROM?
If it is then the following is my opinion on that line of reasoning:
I wonder about games that will use both catridge and CDROM. I'm not saying
that it can't be done but, I doubt it will be done. It's a matter of why
do it. Developers will go for the easier and cheaper route than go the
harder and more expensive route.

:# Third phase, the Jaguar will be seeing many ports of catridge based games
:# to CD-ROM disks so, it'll be facing the same thing as the A1200 -> CD32
:# ports. Most of those CD-ROM ports will carry extra sound, levels, etc.
:#------------------------------

:#No they won't. Why would a game already on cart beconverted to
:#CD-ROM? That makes no sense. Perhaps a sequel or something, but not
:#a direct port.

Why not? They'll most likely offer extras on the CDROM just like CD32
ports. Instead of devising a whole new game just add extras and resell it.
I've seen this happen so many times. It's much easier to add extra stuff
and repackage it to sell to those who haven't bought the previous one as
yet, and to give a little extra who did buy it and want more of the same.

:# The last phase is that the Jaguar will begin seeing more games being
:# available on CD-ROM and shows off the capabilities of the Jaguar.
:#------------------------------

:#This will take a little while, but some developers have Jag CD's right
:#now, so it may happen sooner than you think.

Developers may have it but, which do you think they will bring out software
for? If the CD isn't in the market then it's out of the development phase
til a fair portion of the user base has it.

:#------------------------------
:# Because of Atari providing a catridge based console, it'll take the Jaguar a
:# much longer time in reaching the final phase of software development than
:# if they had initially came out with a CD-ROM based console.
:#------------------------------

:#not that much longer, and if our CD part breaks down the whole machine
:#isin't unusable.

Actually same goes for the CD32. Just attach a drive.

:# Well, I'm not saying that the CD32 is the best on the market, but it is
:# better than the Nintendo/Genesis systems. It also has a good initial price
:# and has been showing a lot of developer support. I believe C= stated about
:# 75 CD32 titles should be out by end of this year. I wouldn't claim that
:# the CD32 will stomp the Jaguar as each has their merits. Same goes for the
:# 3DO though I still don't like that price tag.
:#------------------------------

:#I agree with everything here.

:# :#(in fact, i really don't think it will be able to compete with Jag
:# :# in the marketplace because of the keywords "64-bit" and the 24-bit
:# :# video...)

:# Remains to be seen.
:#------------------------------

:#The only thing I question is how the CD-32's colors will be presented
:#to the public, since they can't really say 24-bit color, and the truth
:#is too confusing for most consumers. I guess ity doesn't matter that
:#much, they can just call it a 32-bit machine.

It a matter for the marketing people.

:# Geez, that was only used as an example of what I had posted earlier about.
:# One title doesn't mean that's all, did you want a listing of what every
:# developer said they are planning on?
:#------------------------------

:#Well, actually, yes we do. We've had them for the Jaguar and 3DO...

I've already replied once to this. I really haven't seen too much about
software development of the Jaguar. I've seen some from people who don't
have anything to do with software development but not really too much from
actual developers. 3DO, I've seen a few postings from actual developers.

:#This has got to rank as one of the most brain dead comments of the day. CDTV was
:#discontinued. The machine that during development was known as CDTV 2 is out
:#there, and has sold half a million units so far. Wake up!

Well, CD32. I don't know if I'd consider CD-I as a viable console. It's
price range is still a bit high. There are improvements slated or already
done but, I think that most people will view it as a past thing.

Phillips should have changed the name to something else to let people know
it's a new machine. Most people who hear of it now and seen the old CD-I
units in Sears and whatever, will be thinking wasn't that what came out 1
or 2 years ago. Hence thinking that it's old stuff.

My money isn't on CD-I that's for sure.

)
)Does any of the games coming out for the Jaguar show off the abilities of
)the Jaguar? You can show off anything with probably about 1 MB maybe even
)less, but what good is it if it is only a demo?
)

Well, I think that the games coming out show off the Jaguar in
different ways. I myself cannot wait to start playing Cybermorph,
which has been said by many others to have really good games play and
be fairly complex. It shows off the gourad shading in hardware, with
lots of shaded 3-d terrain that you can wander around in al you like.
It also has a morphing ship, and I have a soft spot in my heart for
all things that morph. :-)

Cresent Galaxy looks really pretty and shows off the 24-bit color, but
I myself don't like games like that (a side scrolling shooter).

Raiden looks to be cool, and the sound and graphics are said to be
just like the arcade. I'm a really big Raiden fan, so I'm going to
get this one.

Aliens Vs. Preditor sounds really good, with a texture mapped tunnel
system to run around in and do battle with your foes.

I've only seen Cybermorph, Cresent Galaxy, and Raiden in a TV clip,
but that convinced me to buy a Jaguar (along with the developer list).

):# This also, brings into question the next phase of software development.
):# For awhile developers will be still producing games for the Jaguar on

)the CD release stuff like Dracula and 7th Quest won't be coming out. Even
)CD stuff for the Jaguar which will utilize the Jaguar will take more time
)now, since it isn't released with the Jaguar.
)

I believe that the people that make seventh guest have already signed
as Jaguar developers awile ago, and Atari has also said that a few
developers have Jag CD units and are developing stuff for them. I
think there will be a few titles when it comes out, and I don't think
ports will take very long (since they just have to redo the interface
stuff).

)Are you anticipating games that will utilize both the catridge and CDROM?
)If it is then the following is my opinion on that line of reasoning:
)I wonder about games that will use both catridge and CDROM. I'm not saying
)that it can't be done but, I doubt it will be done. It's a matter of why
)do it. Developers will go for the easier and cheaper route than go the
)harder and more expensive route.
)

Well, I'll admit it is unlikley, but I'd really like to see this done.
I don't think it would add much cost to a game over a cart game, as
CD's are cheap and most of the price of a game is development costs.
The question is weither any company will recognize the advantage such
a setup could give.

):# Third phase, the Jaguar will be seeing many ports of catridge based games
):# to CD-ROM disks so, it'll be facing the same thing as the A1200 -> CD32
):# ports. Most of those CD-ROM ports will carry extra sound, levels, etc.

)and repackage it to sell to those who haven't bought the previous one as
)yet, and to give a little extra who did buy it and want more of the same.
)

Like I said, they may release a sequel, but I don't think they'd go so
far as to put the same game (or even a slightly enhanced one) on CD.

Actually, now that I think of it, they might just release the same
game on CD, but not an upgraded one...

Wait, I've thought again. I guess my problem with this is that I'd be
really pissed if I bought a cart and then they soon after released a
CD version with more stuff. You may be right, come to think of it -
don't they do this for some Sega stuff? OK, I'll concede the point.

):# The last phase is that the Jaguar will begin seeing more games being
):# available on CD-ROM and shows off the capabilities of the Jaguar.
):#------------------------------
)
):#This will take a little while, but some developers have Jag CD's right
):#now, so it may happen sooner than you think.
)
)Developers may have it but, which do you think they will bring out software
)for? If the CD isn't in the market then it's out of the development phase
)til a fair portion of the user base has it.

But they need games to release the unit, so someone somewhere is
working on it!!

I think a lot will depend on how soon the initial shipment sells. As
far as I ccan tell, it's been moving pretty well (I think almost all
of the initial units were preordered!!).

)
):#------------------------------
):# Because of Atari providing a catridge based console, it'll take the Jaguar a
):# much longer time in reaching the final phase of software development than
):# if they had initially came out with a CD-ROM based console.

)
):#not that much longer, and if our CD part breaks down the whole machine
):#isin't unusable.
)
)Actually same goes for the CD32. Just attach a drive.
)

Well, perhaps, but a system with a CD as the primary media will have
fairly large games that would be painful to use without a HD. I guess
you could still use one disk Amiga games, but where's the fun in that?

):# Well, I'm not saying that the CD32 is the best on the market, but it is
):# better than the Nintendo/Genesis systems. It also has a good initial price
):# and has been showing a lot of developer support. I believe C= stated about
):# 75 CD32 titles should be out by end of this year. I wouldn't claim that
):# the CD32 will stomp the Jaguar as each has their merits. Same goes for the
):# 3DO though I still don't like that price tag.
):#------------------------------
)
):#I agree with everything here.
)
):# :#(in fact, i really don't think it will be able to compete with Jag
):# :# in the marketplace because of the keywords "64-bit" and the 24-bit
):# :# video...)

)
):# Remains to be seen.
):#------------------------------
)
):#The only thing I question is how the CD-32's colors will be presented
):#to the public, since they can't really say 24-bit color, and the truth
):#is too confusing for most consumers. I guess ity doesn't matter that
):#much, they can just call it a 32-bit machine.
)
)It a matter for the marketing people.
)

True, but the Jaguar has real marketing friendly numbers - "64-bit!!"
sure sounds good on TV, and the press just eats it up.

):# Geez, that was only used as an example of what I had posted earlier about.
):# One title doesn't mean that's all, did you want a listing of what every
):# developer said they are planning on?
):#------------------------------
)
):#Well, actually, yes we do. We've had them for the Jaguar and 3DO...
)
)I've already replied once to this. I really haven't seen too much about
)software development of the Jaguar. I've seen some from people who don't
)have anything to do with software development but not really too much from
)actual developers. 3DO, I've seen a few postings from actual developers.
)

I've seen three posts so far from developers for the Jaguar - Eric
Smith, who works at Atari (I'm not sure what connection he has with
the Jaguar), Some guy from the company working on Kansumi Ninja (which
may be OK - I thought the screen shots looked poor, but apparently
they have not much to do with the final game), and some guy from
Activision. They all of posted at one time or another to
rec.games.video.misc (If I wree them I'd keep out of the advocay
groups too!!).

What I am really more interested in is a list of companies signed on
as developers for the CD-32. I keep hearing stuff like "half the
world population is now a CD-32 developer!!", but I'd like to see an
actual list.

I myself don't hate the CD-32, although some of my replies to the One
Named Clay may have made it look that way. I just think it is less
powerful that the 3DO or Jaguar, and it is too much of a computer
wannabe to suit me (shades of Coleco adam).

It is refreshing to see a reasonable post, though. Me and my blood
pressure thank you.

> The A1200 could run approx 70% of the old A500 stuff.
I'm sorry to intrude, but I've heard this LIE too many times today. Although there are only two "Falcon Only" games I can think of (Transarctica and Ishar) using compatability programs such as BACKWARD, the Falcon gets about 70% compatability with STE compatable games. and all new software I've seen says "ST/STE/Falcon" on it...

> The Falcon today has NO games and is selling very poorly.
With CUbase Audio Falcon now out, the Falcon sales have begun to pick up quite a bit...

Maybe for the Thirty-Two/Sixty Four?? :)
Actually, "Falcon" was the codename for the bigger version (never produced yet) of the new computer. the current "Falcon030" started out as "Sparrow". The name got out, people liked it, and it stuck. I saw an old Atari mag where first rumors of the TT called it an "EST". Personally, I think Falcon is a good name.

)>Ehrm ... okey ... you DO know what the bus-specs are, right? ... 107Mb/s ..
)>that's more than enough for full-screen 32-bit graphics ..
)>(I'm not saying EVERY game will use it - but we talked about MAXIMUM specs!)
)
) Yes, I know the Jaguar specifications very well, thank you. I also know
)how to interpret them, which you obviously don't. Do the maths and tell me
)what you come up with. Q: Is full-screen animation at 768*480*32 possible
)at 30fps? Here's the answer reversed if you don't manage: !oN.

What about 24-bit (I think the other 8 are either Alpha channel or
z-buffer info that doesn't get used in animations). I'd say this is
possible from CD, maybe from a cart. What exactly do you mean by
"animation", anyway? loading a bunch of seperate images into memory
and then page-flipping? the Jaguar should be able to do that
easily...

)
)>SB> 256 colours are more than enough for most games. Coupled with the
)>SB> copper and a good graphic artist, you can do just about anything with
)>SB> that. You really should see some of the stuff we're working on.
)
)>More than 640Kb RAM will never be needed .. :-))))) ... Heard that one before?
)>(Hint - IBM PC)
)
) I never uttered it, that's for sure. I didn't say that 256 colours was
)optimal, but it's enough for most purposes. It's also very practical. I'm
)doing a conversion of Alien Breed II for SEGA right now, and I can tell you
)it's a hell to get all graphics into the cartridge, even though they only
)occupy a little more than 4 bits per pixel. I use some of the most
)sophisticated and efficient data compression algorithms available, but it's
)still difficult to squeeze everything in. Using 24-bit graphics imagery
)wouldn't exactly help.
)

But since you're having so much trouble with compression, would'nt
hardware compression be nice? The Jag has this. The Jag also has a
larger cart size.

I think 256 color graphics are not enough nowadays, and I wouldn't buy
a game system that had a limit like this for practical games. The
whole reason I've waited to buy a game system is to get something that
computers couldn't offer me sound and graphics wise. Otherwise, I'd

rather have a computer.

)>CD> schemes out there only offer about 45% compression.
)
)>:-) .. Graphics compressed with JPEG goes WELL beyond 45% ..
)
) And at a price - fringing. JPEG is lossy, remember?
)

Yes, but not very lossy for 24-bit images - you can compress a 24-bit image pretty far and still have it look almost exactly the same on a 24-bit display.

Another advantage of this is that images on the Jag CD could be compressed, for a much faster loading time - making these colorful graphics more practical to use from CD or cart.

Oh, let me se. There's every PC Clone maker, every new Mac, the Falcon,
The "In the works" projects from Nintendo & Sega, the Jaguar... Just about
everybody except Commodore. I'm talking computers as well as game consoles
here. What does Commodore have against doing a real True Color graphics mode?
It seems to me that HAM modes are a workaround for inferior (i.e. not fast
enough to handle that many bitplanes) graphics hardware.

A. there is no such thing as hardware decompression in the Jaguar. It's
all done in software.

B. Regardless of which compression scheme you use, you're not going to
fit a whole lot of graphics into a 3MB cart. 24-bit graphics are
*extremely* storage-intensive.

>The CD may hold a lot of data, but you can't get at it very quickly,

The difference is that you don't have to compress the data very tightly
when you spool for example HAM8-data off a CD-ROM, since you have lots of
disc space to burn. You'll never see any FMV sequences in Jaguar cart-based
games.

If you think it warrants a fourfold increase in memory and bus bandwidth
use, then OK. As a game designer, I do not think it's a good idea - I'd use
the memory for more varied graphics instead.

>WHat I was doing were some video titling for a school project with my Falcon.

For video titling, this type of anti-aliasing is great. That's why the
Amiga (and CD32) has a 1440x576 graphics mode.

Every PC Clone maker? Possibly. But you're still not going to see any
games using that mode in the near future simply because it's not standard
in most machines.

Every new Mac? Sure. All Mac models sold today may have 24-bit capability,
but the VRAM of some models does not allow it.

Falcon? Sure, it's got 16-bit graphics, but who's using it?

SEGA & Nintendo "in the works" systems? I was talking about things
available today, not in 1995.

>What does Commodore have against doing a real True Color graphics mode?
>It seems to me that HAM modes are a workaround for inferior (i.e. not fast
>enough to handle that many bitplanes) graphics hardware.

Commodore would certainly have had truecolor capability in the CD32 if it had a chipset that would handle it. The lack of a truecolor mode is not really a problem anyway, even if it would be nice. And HAM8 is very nice - effectively hardware decompression, even though it is not practical to use in all cases.

>Here's an interesting thing I have yet to see come up - how much CD-32
>OS is in RAM? The Jaguar has no OS, leaving 2MB free. the 3DO has an
>800K OS. How much RAM does the CD-32 OS take up?

The CD32 has a 1MB ROM which holds the OS. RAM is only used for buffers
and variable data, which amounts to some 100KB.

>If most of a typical CD-32 game is graphics, then a cartrige could
>hold it. How much of a given CD-32 game is code? I'd say at most 1
>MB (and that would be pushing it!!) If you get an average of 7x
>compression of graphics, that leaves you with 28MB (4MB * 7) of
>graphics, larger than many (any?) current CD-32 titles.

Sure. Just don't forget that 24-bit data occupies 3 times as much data
as 8-bit data, so you won't have more graphics, just more storage space
allocated to it.

>Well, with a cartridge, there is no waste, you moron!!! You put in as
>much ROM as you need.

Do you have any idea how much ROM's cost? They are *expensive*.

>I'd say it is definatey a waste to put a 10MB game on CD-ROM, if I get
>a CD-ROM then the games had better pack the damn CD full to the gills
>- I wan't what I'm paying for!! If all you get is 10MB CD-32 games,
>then the CD-ROM drive is USELESS.

This is silly. Just because a CD-ROM disc can contain 600MB doesn't
mean it has to be packed full with data "to get what you're paying for".
CD^32 games cost less than 30 pounds, so even if a CD game would only
contain as much data as a Jaguar cart could hold, it would be just
as much "worth the money" as the same game on a cartridge (at twice
the price!).

Moreover, there's another advantage to CD's besides the storage space -
CD's are cheap as hell to produce.

>No developer list, eh? Not surprising...

There are developer lists available. I don't feel like typing them in
however. You can do it yourself, though - just jot down the names of all
top Euro developers, and some US companies such as LucasArts, MindScape,
EA, and Acclaim.

>CD-32 stuff? no way.

No, because Commodore computers have a market. In the professional
market, as "multimedia"/graphics workstations, and in the home market,
as hobby/home computers. The A1200 has sold 300,000+ units, how many
Falcons have been sold? 20,000? 15,000?

>Also, they biously used up resources developing the Jaguar, but now
>that it's out, they don't have to spend R&D money anymore.

When you've finished a project, it's time to start on the next-
generation system. If you don't, you're in trouble. Commodore did
this mistake some years ago, and that's why they had economic
diffculties lately.

No, the Jag CD is not available for consumers, but it has been announced, we
have all (at least those with our eyes open) seen pictures of it in the
magazines, it has been demonstrated, and I believe I have seen mention of
developers who have it and are working on games for it.

Do you think it would be wise to release a CD before the games have been
developed for it? I suppose they could have just done some quick ports
of old Amiga/ST/Sega/Nintendo games, but what would be the point. I think
it is better to give the developers time to do some decent work with the
Jags capabilities.

And regarding the 'crap' games that have been shown on the Jag, I think
they are at least as good as anything else that's out there (less the
3DO, maybe) and not bad at all considering they are first generation
games on completely new technology.

Why? I can't see why it couldn't handle it, since it will only take approx.
44MB/s to accomplish. (768*480*4*30 = 44 236 800 byte/s). 32 bits is 4 bytes
you know..... :)

The Jaguar has something they call an object processor. If it works even
remotely as the object processor that you can find in the old Atari Asteroids
games it can help very much to keep down the memoryusage, since the graphics
it will _generate_ in realtime wont take up any memory in true meaning.

>that they would have reason to stretch the facts since they are independant
>of atari.

Much as I like Atari Explorer for official information, there is a reason it tends to get the inside scoop on new hardware and real machine specs: It is not truly independent of Atari. Since at least 1983 when I started reading it, it has been tied directly to Atari; that is why it continues publishing despite falling revenue. Long after Antic and Analog folded their eight-bit magazines, AE kept its coverage, including tutorials and software reviews. Check the magazine masthead, usually on the page after the index (or maybe the same page); somewhere after all the staff names is a little paragraph that I think indicates who owns and publishes AE. If it doesn't say Atari Corp. explicitly, I think it at least gives a clue in that it is published in Sunnyvale, where Atari Corp. has its headquarters.

Allegedly, the Tramiels at some point around 1990 decided they wanted to keep a tighter rein on AE (sometimes called pre-publication review, which when done by governments is declared censorship and is usually illegal.) The result was a lot of friction with the editorial staff, and eventually the Editor-in-Chief, David Ahl, stepped down.

For reviews of third-party products, AE is as good as any other. And for official Atari products descriptions, it usually beats the others into print. But if you're looking for honest criticism, look somewhere else, because you won't see a harsh word against Atari's products or management shortcomings in Atari Explorer.

Here we go: THIS IS FALSE.

Clayton- Ham8 consumes 1/3rd the memory of a 24-bit screen and IT DOES HAS
very small differences. They are for all practical purposes damn hard to
notice and in a TV there's practically no way to distinguish (in 640x xxx).

The are NOT IDENTICAL. For practical purposes they could be considered though.

Charles, I just wanted to point out that actually Ham8 can produce more than the 262,000+ colors that people or even C= claim. Someone mentioned that C= said 256,000 because this is 640x400 in pixels.

If you chose your 64 base registers in such a way that you address the combinations of the lower two bits (less significant bits) you can produce such a display.

Just wanted to point that out...

Kendall, as I said before (from Stefan) you can use this mode for
a game if you put every odd column painted with one of the 64 base registers.

You have to move the bobs on odd boundaries, and again you can always
use sprites. It works and the screen looks darn colorful- particularly
if using a 640x200 mode.

>I consider my Falcons to be a COMPUTER - not a games machine like AMIGAS.

Oh dear. Maybe that's because there are no games for the Falcon, then?
This is a ridiculous argument anyway since there are more professional
applications for the Amiga than the Atari could ever dream of.
------------------------------

Plenty of games for my Falcon - all of the STE games plus some new stuff.

>The BASE Falcon is 4/65 (nowadays 4/85) ... the reason you can buy lower-specs
>ones is because you can upgrade them yourself. (Ask any developer)

Fuzzy logic at work or what? The `base' machine is considered to be
the lowest-spec machine that is sold.
------------------------------

Yeah, but just like the base A1200 it is difficult to use one as is.
The base machine is only there so you can buy your own HD and go right
for 14MB of memory. It also is for the people who don't want any of
the bundled software (although I like the included stuff enough I
bought a Falcon with the HD).

------------------------------
>JT> Why do Atari owners feel such a fear of the CD32??

>We don't, everyone who's seen one laughs at it.

Oh well. The engineers at Texas Instruments laughed pretty hard when
the VIC-20 was released as well, and we all know how that battle turned
out don't we? The TI99/4A went down in flames, even though it was
technically superior.
------------------------------

Well, thank god TI isn't making the Jaguar, Atari is. And we all know
what happened with the game market early on, the 2600 dominated for
years.

You just continue to support my theory that the CD-32 is a crippled
A1200 by your comparison to early computer battles, which are
different than the game system battles (at least for real game systems).

>You don't animate the pics off of a cart (although you could I guess),
>you load the compressed pics into memory with the built in hardware
>decompression and use them from there.

A. there is no such thing as hardware decompression in the Jaguar. It's
all done in software.
------------------------------

I'll look up my sources and try to confirm the hardwareness of this.

B. Regardless of which compression scheme you use, you're not going to
fit a whole lot of graphics into a 3MB cart. 24-bit graphics are
*extremely* storage-intensive.
------------------------------

Yes, and JPEG produces extremely good compression rates - I use as an
example my 4MB (when decompressed to 16-bit image, 24-bit originally)
waterfall that takes only 230k or so of disk space. SO regardless of
hardware or software decompression, you could still fit a lot of stuff
on a cart. Also, I believe the maximum cart size was 5MB?

>The CD may hold a lot of data, but you can't get at it very quickly,
>so you'll have to do the same thing anyway - making the use of
>compression a valid argumnet when comparing against CD-ROM baseed
>systems.

The difference is that you don't have to compress the data very tightly
when you spool for example HAM8-data off a CD-ROM, since you have lots of
disc space to burn. You'll never see any FMV sequences in Jaguar cart-based
games.
------------------------------

The promlem is not one of space, it is one of transfer rate - CD-ROMs
only transfer 300k/sec. Are you telling me that you can store a HAM8
picture in oly 30K? (that's what you'd need to get 30FPS off of CD).
And I don't see why you can't see some FMV off of cart (though not
very long, obviously!!)

I agree that the CD-ROM can hold a lot of stuff, but it does have limits...

>)resolution.

>But it still looks better.

Sure, but does it look good enough to warrant a fourfold increase in
storage space for graphics? Not to mention the fourfold bandwidth demands.
------------------------------

Yes, it is. the memory may be somewhat of an issue, but on a CD space
essentially doesn't matter - and for rendering 3D-images, lots of
colors are really useful, and make things look a LOT better.

>) Plenty of time? Think again. The Jaguar uses a DRAM implementation,

>Why would copying out new stuff to display take 2x the bandwidth? How
>often are you going to change the whole screen?

Every frame (30fps). I thought we were talking about full-screen
animation. That's what I mean with "30fps animation" anyway.
------------------------------

You didn't say 30FPs animation before.

Here's how I see it. If you are just doing a full screen,
non-interactive animation, you either use something like cinepak or
MPEG to spool stuff off of a CD in realtime, or you load everything
into memory and just move the screen address (consuming zero extra
bus). No problem here!

In doing a game, lets say you write out a screen that takes half the
bus as you say. You are then free to move data with a total size of a

bit larger than the screen (you move memory from one place to another,
up to the size of the screen). If you have to erase stuff on the screen, then I guess this would be reduced. Just make the game 15fps!

We haven't taken into account stuff that the object processor is
supposed to be able to do, like just plop 3D objects (or sprites,
perhaps?) directly in the screen output instead of writing to memory
first.

>a CD-ROM then the games had better pack the damn CD full to the gills
>- I wan't what I'm paying for!! If all you get is 10MB CD-32 games,
>then the CD-ROM drive is USELESS.

This is silly. Just because a CD-ROM disc can contain 600MB doesn't mean it has to be packed full with data "to get what you're paying for". CD^32 games cost less than 30 pounds, so even if a CD game would only contain as much data as a Jaguar cart could hold, it would be just as much "worth the money" as the same game on a cartridge (at twice the price!).
---

But the whole thing is that Jag carts will not be "twice the price" of the CD's, it seems that they will cost about the same ($50 - $80 for Jag carts, the same range as 3DO games). Some CD-32 titles may be cheaper, but would I want to buy them at all?

Moreover, there's another advantage to CD's besides the storage space - CD's are cheap as hell to produce.
---

That is true, but it sure hasn't shown to be a real advantage so far...

>No developer list, eh? Not surprising...

There are developer lists available. I don't feel like typing them in however. You can do it yourself, though - just jot down the names of all top Euro developers, and some US companies such as LucasArts, MindScape, EA, and Acclaim.
---

Well, that's a start - that's all I want to see is a list of some of the bigger names!! I had heard Acclaim was one, but all I hear from everyone is the "horde" of other developers. LucasArts is impressive.

>24-bit display.

For "natural" images this is true, but for cartoon-ish images and
other graphics with sharp edges, there is clearly visible fringing

with JPEG.

I think for animated stuff and backrounds and such, that fringing
becomes hardly noticable. I'm willing to live with a little fringing
if it means they can store a lot more on the cart.

>) <...>

>You don't animate the pics off of a cart (although you could I guess),
>you load the compressed pics into memory with the built in hardware
>decompression and use them from there.

A. there is no such thing as hardware decompression in the Jaguar. It's
all done in software.

B. Regardless of which compression scheme you use, you're not going to
fit a whole lot of graphics into a 3MB cart. 24-bit graphics are
*extremely* storage-intensive.
------------------------------

Ok, I just found out where I had info about the above from the Jaguar
FAQ on rec,games.video.misc.

Here's the relevent paragraph:
---------------------------------------------------------------------
The Jaguar contains two megabytes (16 megabits) of fast page-mode DRAM.
Game cartridges can support up to six megabytes (48 megabits) of
uncompressed or compressed information. Compressed data can be uncompressed
in real-time, and can be equivalent to almost 50 megabytes (400 megabits).
Compression is performed with JagPEG, an enhanced JPEG image decompression
mechanism.
---------------------------------------------------------------------

So the Jag carts hold up to 6MB (not 3MB), and the compression may not
be in hardware but is "realtime" (which led me to think hardware). I
still don't see how you could claim realtime decompression of images
without some kind of hardware assist - JPEG is pretty computationally
expensive.

There isn't Kendall. One of the RISC Jaguar chips have to be programmed
for that. This is not HARDWARE decompression.

Ah, but then you are proving Stefan right: almost nobody will use
a true Jaguar 24-bit mode on a cart. You said yourself "4MB (when
decompressed to 16-bit image, 24-bit originally)"
^^^^^^^^^^^^

You don't end up with a 24-bit image, first point.

|> waterfall that takes only 230k or so of disk space. SO regardless of

It's 6 (48 mega-bits) MBytes. That's still way too much memory (230k in
an image). And that image is not true 24-bits!

First, make that around 330k to 355k/sec.

|> Are you telling me that you can store a HAM8
|> picture in oly 30K? (that's what you'd need to get 30FPS off of CD).

No, for example the CDXL format is also compressed, but you don't need
the mega-compression that takes so long of the JPEG. For the Video CD
you need an mpeg card anyway, WICH IS WHAT ATARI ALSO STATED FOR THE JAGUAR.

It also means that HAM8 data for games can be pulled straight off the
CD quite quickly.

|> And I don't see why you can't see some FMV off of cart (though not

What do you mean by "real-time"? The hardware only JPEG and MPEG
decompressors are pretty expensive. Don't you Falcon guys use the
DSP for JPEG decompression? IBM have made a new DSP based modem/
sound-card/FAX/answering-machine-all-in-one-card for the clones that
includes JPEG decompression as well.

Kendall, all I suggest to you on this one is not to believe all you see
written. 'Realtime' looks like a nice word, but it might apply to
a decompression rate that can give you 2 fps, 5 fps, 10 fps, 15fps, etc.
It might take even a second, or say half a second. This is still truly
real-time?

|> I
|> still don't see how you could claim realtime decompression of images

Well, read above. I imagine that the Jaguar sound RISC could decompress
quite quickly, but realtime? Hmmmmmmmmm.....

Well, maybe 'realtime' ;-)

Good question, I myself am not sure - "realtime" is a pretty fuzzy term.

|> I
|> still don't see how you could claim realtime decompression of images
|> without some kind of hardware assist - JPEG is pretty computationally
|> expensive.

Well, read above. I imagine that the Jaguar sound RISC could decompress quite quickly, but realtime? Hmmmmmmmm.....

Well, maybe 'realtime' ;-)
---

Well, actually I personally have never thought of it as something that you could use "on the fly" for animations or anything - I've just thought of it as a useful way to get a lot more info in a cart, that you could just decompress to memory. That still holds true. I think I will stop calling it ardware decompression though - it probably does use the DSP or something to do the decompression.

Let this be a leson to all - Gotta be careful when reading the marketing reports!! :-)

Just wondered ..

I owned a SNES before (kinda cool little machine), and one of the BEST things with it was that almost all the games I had could save to the cartridge's internal SRAM memory ... like, setting, where I finishes etc ..

I read in AEO #20 that the bundled game "Cybermorph" for the Jaguar also has this feature ...

Isn't it kinda hard to save settings to a CD-ROM?

:-)

I know pretty well how many bits there is in a byte, thank you. And I
also know that 44MB/s is what is required to get the picture *DISPLAYED*.
Now, another 44MB/s is required to read new data, and another 44MB/s to
write it to RAM. That adds up to 132 MB/s. Is 132MB/s more or less than
108MB/s ?

The SEGA has similar features (although not as sophisticated as the
Jaguar). You can flip sprites and tiles vertically and horizontally so
you won't have to store one image for each direction a sprite heads. It'a
still hell to fit everything into the cartridge.

> the lowest-spec machine that is sold.

>Yeah, but just like the base A1200 it is difficult to use one as is.

Depends. The A1200 has 2MB of memory which is more than enough for
most games out there. All AGA game developers consider this the
base machine.

> Oh well. The engineers at Texas Instruments laughed pretty hard when

Yes, but only by virtue of being the first machine on the market.
All Atari's successors to the 2600 failed spectacularly (5200, 7200
anyone?).

>You just continue to support my theory that the CD-32 is a crippled
>A1200 by your comparison to early computer battles, which are

I don't agree with your theory, but the analogy with early computer
battles was there to show that the most technically advanced system
is not necessarily the one that comes out as the winner. There are
plenty of other examples (Atari800 <-> C64, Coleco, Intellivision <-> 2600).

If the problem is not one of space, then what is the problem with Jaguar
cartridge-based FMV? That's right - SPACE.

> - CD-ROMs
>only transfer 300k/sec. Are you telling me that you can store a HAM8
>picture in oly 30K? (that's what you'd need to get 30FPS off of CD).

The transfer rate is above 320KB/s, and CDXL on the CD32 (which is not
quite full-screen, but 2/3) manages 25fps (PAL) animation at those rates.
The quality is excellent, as anyone who's seen the CD32 demo discs can
confirm.

>And I don't see why you can't see some FMV off of cart (though not
>very long, obviously!!)

Sure. But it would be a waste of cartridge space, which is bad for
the rest of the game. Cartridge developers are always short on space.

Wouldn't help. That 24-bit data would still use up more memory than the
SEGA graphics do already with the compression methods I use.

>SB> Several times. Regarding the HAM issue some weeks ago, A1200 prices,
>SB> and so on... You often state things you don't know for sure as if they

on this system. I can not quote you, but I have very good memory...

>I know exactly how HAM works (worked in it) and I can back up my statements on
>A1200 prices.

Well, Rickard. Here's what you said about HAM: "It takes three pixels to
change from black to white". You definitely said that. Moreover you've
claimed that the A1200 is only marginally cheaper than the Falcon, while
in real life, you can get an A1200 with a 80MB HD for 5500 SEK quite easily
if you shop around a little (like looking through the ads in DMz). You
claimed it cost 8000 SEK. Quite some difference.

And I'm sure you can back up your statements on A1200 prices. There's
always people who sell machines more expensively than others. Your basic
customer however often shops around a bit to get the cheapest possible,
instead of buying from the expensive dealer. I can easily find a 486
costing over 20,000 SEK. I can also quite easily find one that sells it
for half that.

>That's how the Jaguar does it.

You're pretty dense. Neither of those options are called hardware
decompression. Hardware decompression does not consist of software in
ROM (that's FIRMWARE), it consists of a digital circuit that performs
the decompression without software assist. C-Cube manufactures such
things.

>If you're such a good developer, you wouldn't even post such bullshit as you
>do.

Oh my. Look who's talking. Point me to one falsehood I've stated, please.
At least I have documentation to back my claims up. Your posts are full
of inference for the most part.

>SB> B. Regardless of which compression scheme you use, you're not going to
>SB> fit a whole lot of graphics into a 3MB cart. 24-bit graphics are
>SB> *extremely* storage-intensive.

>6MB .. MEGABYTE ... where did you get 3MB from .. another lie?

Oh dear. Just because the SEGA can accommodate 4MB cartridges doesn't
mean that every SEGA game is 4MB. ROM is *expensive*, and you will most
of the time settle for less than the maximum if you are able to, since
your revenue will be greater if your expenses are lower (pretty basic
maths, no?).

>24bit compressed AREN'T ... add to that that you can do a lot of gouraud

Who the hell wants to see actors play theatre when I might as well read
the script or the book at home?

>SB> ========== Disclaimer: I only speak for myself, not Team 17. ============

>Wonder why Team17 doesn't agree with you.

Amazing. In case you don't know what that disclaimer means, here's some
explanation for you: I work for Team 17, but that doesn't mean that
everything I say is considered to be official statements from the company,
but rather from ME as a person - not as a Team 17 employee. Team 17 pay
me to program, not to argue with Atari fanatics. That doesn't mean they
don't agree with me.

No I don't develop for the Jaguar. At least not yet. If the machine
takes off and sells enough to be economically viable to develop for,
we will certainly develop for it. I have been exposed to Jaguar
development documentation, nevertheless (through people that are
Jag developers), and we have occasional contacts with Atari.

Exactly! To give you an idea Kendall, having a scheme where the
ROM/RAM is compressed and decompressed in real-time is something that
is just being started to talk about, and so far is darn hard to do that.
You need relatively speaking $expensive$ technology and the effective
bandwidth you get is on the order of 10 to 20 megs/sec.

Now, if you have a 'wimpy' compression scheme, I guess you can
decompress 'in realtime'- my Amiga does it with the Anim format :-)

|>
|> Well, the atari 2600 had virtually no competition.
|> ------------------------------
|>
|> I wouldn't say that, it had Intellivision and Coleco among others.

The Intellivision and Coleco came QUITE AFTER the A2600 was selling.
Heck, the A2600 was selling even before the ATARI home 8-bit computers!

(as just the 'ATARI' and the 'SEARS TELE-GAMES'). By that time,
it took the market already pretty much.

The Jaguar, on the other hand, is competing today against the established
Super-NES, and the Super-established Sega Genesis. (and looks like the
decently established CD-32 in Europe).

No flames, I like the prospect of the Jaguar- but I'm realistic.

My point is that the image you compressed is 16-bit. A 24-bit image
takes more, more than the 2xxk you took with your 16-bit image.
The whole point was that since 24-bit images take much more memory,
the Jaguar probably won't have a lot in a cartridge, and get away using
less colors than a 24-bit display.

It will still look good, no doubt ;-)

Yes, C= has already shown it with CDXL.

|> I guess if you use delta
|> animation and a lot of the screen doesn't change very quickly...
|>

Yep, it happens with CinePak too. Have you seen the 3DO? On huge'
deltas, it slows down a bit.

Like 'Ham8' fringes badly among other things. Admit it Rickard, you are an ignorant where Ham8 is concerned.

|> I know exactly how HAM works (worked in it) and I can back up my statements on
|> A1200 prices.

Now, you didn't. You haven't used Ham8 and you very well implied that in another of your posts ("I could distinguish between a 24-bit display and a HAM display easily").

You are an ignorant Rickard, so shut up, try things before you post.

About A1200 prices, since I don't live in Sweden, I don't know- but surely here and the UK the reality is different- AND SINCE the SUN doesn't revolve around Sweden- too bad for you.

Stefan already backed up his #'er on Amount of A1200's sold... are you willing to take back your accusations and admit it?

300,000 machines worldwide... that's quite a nice number... Probably after Christmas it would hit the 400,000 mark easily, and this without taking the CD-32's into account.

Ah, but that IS NOT hardware decompression....

|>
|> If you're such a good developer, you wouldn't even post such bullshit as you
|> do.

And if you really know how to program, YOU WOULDN'T EVEN POST AT ALL.

Let's review your track record Rickard:

1- Ham8 doesn't look like 24-bits, "I have programmed in HAM, I know"

BZZZZZZZZZT! HAM is not equal to HAM8 wich obviously you haven't seen.

2- You can't animate in Ham8:

BZZZZZZZZZT! I do it every day using Scala and DeluxePaint IV AGA
for 2D & 3D video work

3- You can't make a game in Ham8:

BZZZZZZZZZT! Yes, you can. You can use the sprites, or like Stefan
explained (maybe it was just too hard for you to comprehend):

Making every odd column one of the 64 base registers, same
with the bobs, move them in those boundaries. Use 640x xxx res.

The screen will look darn colorful, no side effect fringing when
moving the bobs.

4- The Falcon can use BURST mode

BZZZZZZZZZT! Motorola requires 32-bit datapath access to memory. And BTW,
NOBODY here has dared to try turning burst mode on and
off to see if there's a difference.

You are supposed to be a 'programmer' Rickard, what happened?

Maybe you are just 'computationally challenged' like Windows 3.1...

5- 199 UKP for the FMV unit ALONE????? [Raist note: regarding the MPEG CD-32]

Wow .. :-) .. Now I know what NOT to buy ..

BZZZZZZZZZT! Guess how much will that unit be for the ATARI Jaguar or CD-I or
3DO? (and ALONE, yes, ALONE). It will be around the same
price or even more expensive (CD-I case)

6- SB> other graphics with sharp edges, there is clearly visible fringing
SB> with JPEG.

>Not as much as with HAM8!

BZZZZZZZZZT! HAM8 fringes can be avoided by carefully choosing the 64-registers.
This require no hardmath because there is a lot of programs
that will do it for you (ImageFX- commerical, ADPro- commercial
, Render24 - Public Domain). SINCE YOU HAVEN'T SEEN HAM8
*ANYWAY* YOU DON'T KNOW. Ditto.

7- The A1200 hasn't been selling well, or just hinting that the Falcon has
been selling better:

BZZZZZZZZZT! The A1200 has now officialy more than 300,000 computers worldwide,
the Falcon - ATARI themselves admitted it has been selling
really slow. Please, no offense or flame to Falcon owners,
I have recommended the Falcon to two friends of mine interested
in connecting a midi keyboard to a computer. This is intended
for blind master Rickard, who believes the Universe revolves
around Sweden.

8- SB> Fuzzy logic at work or what? The `base' machine is considered to be
SB> the lowest-spec machine that is sold. [Raist note: regarding the Falcon
that is sold with no hardisk]

>Nope, the base-machine is the one developers consider to be the base-machine.
>(Sometimes one really wonders if you are a developer at all .. )

BZZZZZZZZZT! And using your own logic, what makes you think that the
A1200 with just 2 megs chip ram is the low-level base
machine?

On the other hand, whatever machine sells the most,
becomes the base machine- developers want it or not.
Those that see reality, earn money, those that don't
go chapter 11 in the US (bankruptcy).

So if ATARI has a less expensive Falcon model, probably
the model that would sell the most would be the most

inexpensive, unless the Falcon market is made of people
that can afford more than $1,500 US dollars (which isn't
the ST/STE market, of which many want a Falcon)

9- |> Who the hell wants to view FMV sequences when trying to play a game? If I want
|> to watch FMV I'll go for MOVIES .. not GAMES ...

BZZZZZZZZZT! FMV movie clips like scenes when you finish the game, you
accomplish certain parts of the game, etc. ***are very
rewarding*** to the player and help
with the story/plot. The mere fact that 3DO and
the SEGA CD are doing this proves you wrong. Actually,
this is one of their most touted features for games!

And then, there are those games like Dragon's Lair
which a lot of people like, that are just made
of a lot of this.

10- Stefan isn't a good developer (implied):

BZZZZZZZZZT! Stefan has brought to the Amiga community LHA, and works on the
'Team 17' development company (also for Psygnosis from what I read
in a recent post of his). The 'Team 17' has come out with
excellent games for the Amiga (Alien Breed II), and working
for Psygnosis kind of sez it all.

Now, since we judged someone, let's judge you Rickard:

Where do you work and what have you done?

We have to be fair here...

Most of the moving graphics can be highly compressed, due to their
motion. Since they won't be around long enough for you to study them
their lossyness won't be as important.

Also, of course, the JAG-CD is a dual-speed thing, so buy that, and
all this becomes academic. Drag compressed images from CD, and you
ought to get fantastic frame-rate graphics.

Simon.

True, but the same applies to CD-32, doesn't it?

Also, let's wait for the Jaguar CD to TRULY come out, we are talking again about 'vaporware.'

>Yes, it is. the memory may be somewhat of an issue, but on a CD space
>essentially doesn't matter - and for rendering 3D-images, lots of
>colors are really useful, and make things look a LOT better.

Ahem. Since when did the Jaguar have a CD? The whole point was that
it's not likely that Jaguar games would use the higher resolution.

> >Why would copying out new stuff to display take 2x the bandwidth? How
> >often are you going to change the whole screen?

> Every frame (30fps). I thought we were talking about full-screen
> animation. That's what I mean with "30fps animation" anyway.

>You didn't say 30FPs animation before.

That's right, I did not. You did.

>Here's how I see it. If you are just doing a full screen,
>non-interactive animation, you either use something like cinepak or
>MPEG to spool stuff off of a CD in realtime, or you load everything
>into memory and just move the screen address (consuming zero extra
>bus). No problem here!

There are plenty of holes in your argument here. First of all, in
the spooling off CD, you will have to employ compression or use CLUT
based modes, because you won't be able to spool 24-bit data off CD,
and that takes plenty of bus bandwidth (although a bit less than
memory->memory copy). Loading everything into memory really isn't
an option either since each full frame would occupy 1.5MB.

>We haven't taken into account stuff that the object processor is
>supposed to be able to do, like just plop 3D objects (or sprites,
>perhaps?) directly in the screen output instead of writing to memory
>first.

The Object processor still has to read the images from RAM.

>any real true color mode.

If the next system from Commodore uses the AAA chipset which is being
developed now, then it will have truecolor capability in resolutions up
to 1280x1024. The AAA chipset has been "announced".

)
) Wouldn't help. That 24-bit data would still use up more memory than the
)SEGA graphics do already with the compression methods I use.
)

I thought you said you were getting something like 50% compression?
If the sega has 8-bit graphics, then the compressiobn for JPEG still
renders a smaller cmpression size than the sega picture, allowing you
to hold a lot more graphics than the sega can access.

Or are you talking about main memory? The Jaguar still has a bit more
memory that the Genesis, so you could hold a roughly eqivilent amount
of uncompressed images in memory.

)
)>Why? I can't see why it couldn't handle it, since it will only take approx.
)>44MB/s to accomplish. (768*480*4*30 = 44 236 800 byte/s). 32 bits is 4 bytes
)>you know..... :)
)
) I know pretty well how many bits there is in a byte, thank you. And I
)also know that 44MB/s is what is required to get the picture *DISPLAYED*.
)Now, another 44MB/s is required to read new data, and another 44MB/s to
)write it to RAM. That adds up to 132 MB/s. Is 132MB/s more or less than
)108MB/s ?
)

Why are you reading the image then writing it back out to memory? If
you're using sprites, then you just do a memory to memory copy. Also,
why are we using 30FPS when something a bit lower (like 15-17fps)
would do.

)>>occupy a little more than 4 bits per pixel. I use some of the most
)>>sophisticated and efficient data compression algorithms available, but it's
)>>still difficult to squeeze everything in. Using 24-bit graphics imagery
)>>wouldn't exactly help.
)
)>The Jaguar has something they call an object processor. If it works even
)>remotely as the object processor that you can find in the old Atari Asteroids
)>games it can help very much to keep down the memoryusage, since the graphics
)>it will _generate_ in realtime wont take up any memory in true meaning.
)
) The SEGA has similar features (although not as sophisticated as the
)Jaguar). You can flip sprites and tiles vertically and horizontally so
)you won't have to store one image for each direction a sprite heads. It'a
)still hell to fit everything into the cartridge.
)

But the Jaguar offers a better compression rate, even including the
fact that the sega uses 8-bit grpahics and the Jaguar uses 24-bit. In
other words, the same image at 24-bits would compress to a slightly

smaller size than the same image compresses to on the Sega from 8
bits.

I agree about the hardware decompression thing now, but it still
changes none of my arguments about the use of it.

As for not lying, I'll agree that you are not lying - but saying that
you would gain nothing by it is a weak argument in an advocacy gruop -
whose only purpose is to convince other people through argument!! :-)

But it doesn't mean that the wouldn't throw in a little for something like the ending reward sequence or something - they do stuff like the now on SNES and Genisis carts! I'm not saying that it would be widley used, just that it is possible and will probably be used a little bit.

> but in all the nice color fades, the steps would nearly all be 18-bit. So,
> for a picture with many different colors, HAM8 is perfect.

No, it's not perfect. I'm sure you can contrive a picture for which it is
perfect, but for an average 24-bit color picture HAM8 cannot perfectly
display that picture. There will be color fringing artifacts due to the
inherent nature of the HAM technique. Now, whether the average person
would notice much of a difference between the 24-bit picture and a HAM8
version of the picture is a different matter. But HAM8 inherently cannot
perfectly represent an arbitrary 24 bit/pixel image.

>For a picture
> with many different shades of the same color, 256-color mode is much better.
> Anyway, you have a choice. (Btw, you have 64 base colors from which to

I know how HAM8 works, which is why I said for many (not "all") pixels
the color was dependent on the previous pixel.

> Anyway, I
> don't think you would run a game on a Jag in 24-bit mode. It would take a
> hell of a memory bandwidth for that, both for the display and for blitting
> around the objects.

Which is why I said that animation is one of HAM8's strenths.

> It's nice for pictures, though - but so is HAM8.

Maybe HAM8 is good for looking at still pictures, but not for things like image processing or photographic editing. HAM8 requires (lossy) translations back and forth between the HAM format and a direct mapped color scheme (e.g., RGB or YUV) when doing these types of operations.

> (For all of you who don't know, if you set a component, only the top 6 bits
> are affected. The lower two are left intact. So by carefully setting up the
> palette, you can have a different color on every pixel on the screen in any
> screen resolution, up to 1400x600 50Hz-interlace, or 800x600
> 72Hz-interlace.)

Sigh... You misunderstand. The strength of a 24 bit/pixel display isn't that every pixel on the screen can be a unique color. It's that for every pixel on the screen you can _choose_ the color you want it to be from a palette of 16 million colors. HAM8 does not allow this since the color of many/most pixels on the screen is related to the color of the previous pixel.

Sure, and any Mac out a year ago is considered Obsolete. Just ask Sinclap. :)
All of those had True Color ability by just purchasing more VRAM, though...
Can you do that with an Amiga or a CD^32? No. you have to purchase a whole
graphics card.

> If the next system from Commodore uses the AAA chipset which is being

If that is true, I am sorry. But I heard that AAA had something (HAM12?) that
was still not True Color.

: this feature ...

: Isn't it kinda hard to save settings to a CD-ROM?

The 3DO and CD^32 come with SRAM. Nearly *ALL* the &$!@&@# consoles
on the market are shipping with SRAM. I'd prefer a floppy disk or
pop-out SRAM cartridge so you can swap things around in the SRAM.

I've heard that the CD^32 and 3DO don't tend to whomp over data from
other games, which suggests that either each game uses its own
portion and ram and it is just pure luck that it hasn't over-written
another games data, or that the o.s in each system tries to manage
the memory.

While, were onto stupid arguments, isn't it hard to stores MB's of
data in SRAM?

>Thats funny, I have a 21" monitor about 6 feet away from me that has been doing
>PAL/NTSC perfectly on my Amiga for several years now.

a) Those multiscan monitors are no longer available (scan rates of newer multiscans start at 30-31 kHz)
b) new multiscans cannot display AGA graphics (if you don't have a ScanDoubler) and monitors <17" will not display 1280 pixels horizontally (the limit of 14" monitors is about 900 pixels, Michael van Elst told me :-))
c) Using a 21" monitor as an Amiga display is a waste of money (unless you have a graphics board), IMHO

Well, actually it's not. The real drift-velocity of electrons in
copper is in the order of some cm/s. The `velocity' of electricity is
much higher, but the analogy is that you have a tube full of marbles;
push one in at the one end, and (almost) simultaneously the last one
will come out, although the absolute speed of each marble is not that
high.

But anyway. You are (probably) right on the rest of the stuff.

# 3159. Jaguar mailorder

Newsgroup: comp.sys.atari.advocacy
Date: 1993-11-29 09:44:32 UTC
From: an53758@anon.penet.fi
Message-ID: <095314Z29111993@anon.penet.fi>
Source record: 20092
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

Followup-To:comp.sys.atari.advocacy

!The Jaguar 64bit game machine has arrived! It is packed with a
action strategy game called Cybermorph (similar to Rescue on
Fractalus) that is fun and absorbing. Keep a watch out for
DOOM from id Software and 3D Aliens versus Predator too.

Ok to get it mail order call any of these folx :

G&G Software 800-262-7462 (~$249)

J&R Music World 800-221-8180 (~$239)

The Wiz (908) 602-1950 (~$249)

Next thing to do is replace the flaky Jaguar RF modulator/cable
with the Jaguar SVIDEO/Stereo cable from Redmond Cable. Run (do
not walk) with your order to 17371-A1 NE 67th Street, Redmond,
WA 98052 (or call (206) 882-2009). Use a Sega/SNES modulator and
cable if you have to but get the Redmond cable if yu can!

Any other info about the other new consoles?

Being a Mac/Newton type of guy, I believe this is the best approach:

"The document 'Moof' has changed.
Do you want to save this file?"

Don't Save Cancel Save

The least desirable choice should be far to the left, and the safest
choice should be the default button (hilited with bounding box) and
on the right. If a user hits return, the default action happens.
Of course, the standard key equiv's should be used, "D" for don't save,
esc for cancel, and return for Save.

Steve

> The Object processor still has to read the images from RAM.
As far as I know the object processor can do the following:
Put an object (sprite) to screen. The size of the sprite is unlimited. This is
like the new screens on Amiga (if I'm informed correctly) where you can have
different rectangular views (in different resolutions) to memory. On the Jaguar
the objects can also be scaled. This is in fact the same way the Lynx works.

The blitter does things like Gouraud shading.

The GPU is probably the 3D engine.

Can anyone tell me what chip does what tasks????

I wonder how the C-Cube works. My opinion is that it's a very simple RISC
processor with some code in ROM and some data in SRAM which is so damn fast
that it does the decompression on the fly.
Now is the C-Cube hardware or software ?
It's still hardware, because it's a chip which does only that.
Then I would prefer a software decompression, because you can use the processor
power for other tasks than only decompressing Jpeg ...

## 3164. Falcon Games

Newsgroup: comp.sys.atari.advocacy
Date: 1993-11-29 10:50:14 UTC
From: Iain.Laskey@barclays.co.uk
Message-ID: <CH923r.5n0@barclays.co.uk>
Source record: 20097

To all those people who keep saying there is no Falcon game software and that ST games don't run on it.

Ishar 1 & 2 and Transartica are out. More are on the way. There is Space Junk on the way and I've seen a list with about 20 other game titles on the way. You can also play the majority of ST games via the Backwards utility. Ishar 2 I have and with 256 colors and great sampled sound all the way through, it's great to play (and just to watch!).

How about Ishar 2, Space Junk, Transartica?

|> BTW Are there ANY games for the Falcon? I hear it won`t run ST games
|> (no great loss, but at least there would`ve been some software for
|> Falcon owners to run, and a good reason for ST owners to upgrade).
Wrong. There ARE Falcon only games and you can run most ST games on a Falcon via a PD prog called Backwards.

|> its worth.
I've seen 4Mb Falcons at 499GBP (Gasteiner, price confirmed by phone). The base Falcon is rather higher in spec than a 1200 but then a 1200 is about 250GBP so it ought to be!

|> Why do Atari owners feel such a fear of the CD32??
|> They seem to need to slag it at every oppotunity. Do they see it
|> doing the same to the Jaguar as the A1200 did to the Falcon??
Not at all. The Jag is far superior to the CD32 in all respects. I would imagine the main market for the CD32 is Amiga people who buy anything Commodore. That said, in the UK, I'm told by Silica that it is selling like hot cakes..

I (perhaps wronlgy) believed that the Jaguar will be a cart based machines,
at least for a while with the CD-ROM drive being an added extra later on.

This being the case you can save to the SRAM in the cart.

Simon Gornall (sjg@phlim.ph.kcl.ac.uk) wrote:
: The rate at which the bus runs is the clock rate. It has nothing to
: do with the speed of electrons through copper, which is orders of
: magnitude of m/s faster than 16 million... Can you not see the
: possibility of having a 16MHz clock rate at the chip, being driven
: off chip via a 32-bit bus, and converted via a multiplexer into 2
: 16-bit signals, then de-multiplexing at the other end. Run your
: intermediate bus at 32MHz, and the '030 will never know the
: difference.

Well, all you're saying is: "If the Falcon would have had a better
processor to memory bus, the bus would not be crippled." How nice. The
issue is: _Is_ the Falcon bus between processor and memory 16-bit and,
if so, _is_ it multiplexed and thus the same speed as a 32-bit bus?

Have fun, Kristofer.

Not true. Only a few RPG games have the battery backup memory. The only game
I own for the SNES that has SRAM is Super Mario World (okay... no, that's not
really an RPG, but most of the others with SRAM are).

The Jaguar is more than vague. People in the US have them in their hands NOW! I'm
in the UK and I have one on order. Delivery is due in the next couple of weeks.

No, for types like you you deserve it...

|> Ham8 is lossy .... VERY lossy ... still some bloody amigoids call it "24bit
|> graphics" .. go kick their asses ...

I have done it to Clayton. But Clayton even sounds more reasonable than
you are (and I know he sounds really stupid).

You have no clue about what you are talking about, do you Rickard?

"I have programmed HAM, so I know what I am talking about" -DUH!

>>>>>>>>>>>>> HAM IS NOT EQUAL TO HAM8

Rickard, don't be so tight-*sshole minded, please, like Stefan suggested
once (and I did it), get something like Image FX and do a substract
on a 24-bit image using a HAM8 image- the 'lossines' is really extremely
little.

Now, since OBVIOUSLY YOU DON'T KNOW WHAT YOU ARE TALKING ABOUT,
shut up.

Be objectvie, do what I propose and then post your conclusions about
'HAM8' being lossy.

Just in case, mind you, CD-32 has memory internally so you can save memory to it (flash memory).

Food for your own though.

|> RH> seen.
|>
|> Does HAM8 look like 24-bit?

Yes, on an RGB monitor it looks like 24-bits. ON a TV signal it is virtually undistinguishable.

|>
|> RH> 2- You can't animate in Ham8:
|> RH>
|> RH> BZZZZZZZZZT! I do it every day using Scala and DeluxePaint IV AGA
|> RH> for 2D & 3D video work

|> demos which was the issue we were discussing!)

Originally you said that you can't even animate it. And yes, you can animate for games in 50fps with CPU time left.... I was talking about FULL SCREEN animation, which the Ham8 provides even far more flexibility because it doesn't consume as much memory as 16-bit and 24-bit displays and can animate faster.

|> RH> 3- You can't make a game in Ham8:
|> RH>

|> RH> isn't
|> RH> the ST/STE market, of which many want a Falcon)
|>
|> Error .. of all the Falcon owners in Sweden there's not anyone owning a Falcon
|> 1/0 who hasn't upgraded to atleast 4 meg and a harddrive .. I think I know that
|> better than you ..

Yep, just like point #7 above, right?

|>
|> RH> BZZZZZZZZZT! FMV movie clips like scenes when you finish the game,
|> RH> you
|> RH> accomplish certain parts of the game, etc. ***are very
|> RH>
|> RH> rewarding*** to the player and help
|> RH> with the story/plot. The mere fact that 3DO and
|> RH> the SEGA CD are doing this proves you wrong.
|> RH> Actually,
|> RH> this is one of their most touted features for games!
|>
|> Hehe .. reviews from the SEGA-CD ... "no game-play, just a movie" .. (that
|> car-game .. "played" it myself a few days ago .. )

Laugh as much as you can- it has been selling *BIG TIME*.

|> RH> And then, there are those games like Dragon's Lair
|> RH> which a lot of people like, that are just made
|> RH> of a lot of this.
|>
|> Then do that in realtime vector on the Jaguar instead of using graphics ..

That still doesn't mean there's no room for the movie genre....

|>
|> RH> 10- Stefan isn't a good developer (implied):
|>
|> Error, don't lie.

I am not- you questioned it by saying: Sometimes I wonder if you are a developer at all.

AND BTW, I see that you ommited:

4- The Falcon can use BURST mode

5- 199 UKP for the FMV unit ALONE????? [Raist note: regarding the MPEG CD-32]

Why? (I can WELL IMAGINE though)

I acknlowedge that. It's you who has to acknolwedge that the lower-base Falcon will be the 'base machine' for things as games. For applications, the A1200 for a lot of them is not a base machine (Real 3D comes to mind).

|> SB> I don't agree with your theory, but the analogy with early computer

|> .... (I've heard 70%, but I don't remember where and can't back it up, don't
|> quote me on that)

It's not that much, and ironically SEGA has been regaining a little bit back thanks to more agressive marketing and some innovative stuff (like the virtual reality helmet and virtual infrared-ring).

The 'mythical object processor'- Rickard, you are talking to Stefan who has been exposed to Jaguar tech development information. He definitively knows much more than you do.

In a picture, having the 64-base colors, this DOES NOT HAPPEN. You make it sound that it happens so often it looks bad.

SINCE YOU DON'T KNOW HAM8 though, don't talk about it.

Well, people change you know. Originally the Jaguar's rollout was supposed
to be October, then the schedule went to early november and then late November.

And if ATARI follows the same release schedule they did with the Falcon,
the CD might be out by early 1995!

And CD-32? It can also (and will) use overscan too, you know.

The SEGA's graphics is 4-bit, from one of four palettes on each pattern
(8x8 pixels). This is further compressed by my routines to less than 50%
of their original size. Thus you end up with less than 2 bits per pixel,
when compressed.

>Or are you talking about main memory? The Jaguar still has a bit more
>memory that the Genesis, so you could hold a roughly eqivilent amount
>of uncompressed images in memory.

No. I'm talking about ROM space. ROM costs are so high that games over
2MB are not considered economically viable with todays ROM prices (except
perhaps for some big-name titles that can be sold for more than the usual
games). That applies to Jaguar games as well.

>)write it to RAM. That adds up to 132 MB/s. Is 132MB/s more or less than
>)108MB/s ?

>Why are you reading the image then writing it back out to memory?

Because in a memory copy, you have to read some data from the source
address before you can write anything to the destination.

>If you're using sprites, then you just do a memory to memory copy. Also,
>why are we using 30FPS when something a bit lower (like 15-17fps)

Because 15-17fps looks jerky. Neither the producer nor the consumer
wants jerky games.

>Does then sun only revolve around UK then?

The sun doesn't revolve around anything but the centre of the galaxy. :-)
I thought it was common knowledge that the earth revolved around the sun,
and not the other way around.

>RH> Stefan already backed up his #'er on Amount of A1200's sold... are you
>RH> willing to take back your accusations and admit it?

>Nope, the A1200 hasn't sold well in Sweden.

Strange. Commodore Sweden did much better this year than any other year
before it, and they only sell the A1200, A4000 and CD32 nowadays. Wonder
what generates all that revenue, then?

>You don't expect A1200 owners to buy CD32s, do ya? :-) .. they can already get
>ALL the CD32 games as pirated copies on their A1200/HDs ...

Uh, huh. But not tomorrows CD32 games, that's for sure, unless someone
is willing to download 100MB games or start trading with SyQuest disks.

>Face it, CD32 has ONE market .... Amiga owners ... and all those who bought
>the A1200 will probably NOT buy the CD32 ..

No, they'll probably buy the CD32 expansion unit for the A1200 instead.
Makes more sense.

>(Whereas almost ALL Falcon owners seem to go for the Jaguar)

Oh, boy. Lucky Atari. A mind-boggling 10,000 units! ;-)

Didn't you see that I included the Coleco, Intellivision <-> 2600 up
there? The 2600 was inferior to both the Coleco and Intellivision, but
managed to grab a chunk of the market simply because it was first and
enjoyed decent third-party support from the likes of Activision (which
Atari ironically actually tried to kill).

>remember that SNES *GRABBED* 50% of Sega's market right away

That was true a while ago, but it has changed drastically. SEGA dominates
the european market, and is eating up Nintendo's lead in the US (only a
few percent behind now). With Nintendo reporting a loss this quarter, it
looks like SEGA will continue their winning streak.

The only place where Nintendo has a clear lead is in Japan.

What you claimed was that it always took 3 pixels to change from black
to white. You did not even know about base colours before it was explained
to you. Moreover, 64 basecolours is more than you think, and you will almost
certainly have one of those basecolours set to black, and one to white, if
those colours are in the picture you're converting. The algorithms to
choose what basecolours to use have matured a lot since the early Amiga
days, and work extremely well.

>The Falcon030/85/4 is down to 10400:- now from Vara Datalager ..

You know, that's just 4600:- less than I paid for my A4000/040/120M/6M,
but then I get pretty nice discounts from Commodore ;-)

Sure would. I like anything that makes my job easier. I'm quite interested
in working on the Jaguar, and will certainly do that if it takes off, since
I'm more or less the Team 17 tech support person. Thus I'm the one who gets
to play with new systems first ;-)

>:-) .. That's true, books ARE better than movies ..

Sometimes, sometimes not. A book is not better than watching a movie in
a cinema with THX sound. At least if you're an audiophile like I am :-)

>Are Team17 Jaguar developers, or how come you have access to the developers
>information?

We have not yet signed up as developers (maybe in a year or so), but let's
just say that I know people (who for their sake shall remain unnamed) who
have, and that I have been exposed to their docs. That means somebody has
broken their non-disclosure agreement, but my curiosity has been quenched
somewhat, so what the hell ... I won't pass any of the information on
anyway.

>(According to Atari Sweden it will go on sale here in February)

No. I checked this up, and Atari first said that the CD unit would be
launched in March, but later changed it to September 1994. The official
reason was that they wanted to wait for decent CD games to come out for
it.

>SB> >Great, now we all know that the CD32 will use 320*200 .. I will remember

>game said it was a higher resolution ... )

The figure for the CD32 isn't really 320*200, since most games will be
PAL (320*256) and have overscanned screens (usually 352 or 384 pixels
horizontally, and up to 284 vertically). All games I've been involved
with has been using 352*256-ish display windows, which is just about
how much you can use because most TV sets just can't display more than
that on the screen.

Get some reading glasses and read that over again. I was talking about
fringes. Fringes are inavoidable on sharp edges (text and such) in JPEG,
while you can use basecolours in HAM8 to avoid them.

Shouldn't there be a smiley here? Or maybe this article should be
cross-posted to alt.philosophy or maybe rec.humor.

We could apply your statement to anything you haven't seen, does that
mean it isn't real? Doesn't "real" usually refer to something that
exists? Or if your gripe is just that someone "claims" it exists,
I think it's a bit ridiculuous to discount the testimony of tens or
hundreds of owners and developers. Oh no! Maybe it's a worldwide
conspiracy to fool _you_ into thinking the Jaguar exists!

To sum up, I've never seen a Cray XMP Supercomputer, nor have I
ever seen the Antlantic Ocean with my own two eyes. I guess they
must be fantasies dreamed up in some marketing ploy!

:-) (followups to alt.philosophy, if it exists... :)

But if cartridges can have battery-backed upo SRAM, then Atari could produce SRAM carts for CD-based games to save lots of locations. The advantage of the piggy-back CD unit with Cart pass through perhaps lies here?

I read the transcript of an interview with Dave Haynie, one of Commodore's top
R&D people, and he claims that they have a demo AAA machine blitting around a
24-bit pure image significantly faster than an Amiga 4000 can blit around a
256-color full-screen image of the same size.

Lets hope for the best. :)

Hmm, not only have I seen the Jag ads in Gamepro, and televised spots
on TV, but I've heard from numerous people in rec.games.video.misc who
own one.

In fact, from the evidence at hand I'd be hard pressed to say the
CD-32 exists, if anything. I think I've only seen posts from two
CD-32 owners so far.

I'm afraid you are quite simply wrong. Atari makes very few (compared to 4/85 machines) of the 1/0 Falcons. These are and always have been from day one considered to be for those who want to add their own memory boards and Hard Drives. In the Falcon Developer Docs, where it has guidelines for game programmers, it mentions that all games should be Hard Drive installable, able to be run from any resolution and able to quit from the desktop, and ideally be able to be run from MultiTOS. Now this sounds like the "Base Machine" for game programming would include a Hard Drive and at least 4 megs RAM, no?

-
>

I dont think you understand what I said.

I have two televisions in my room (A 1992 model Toshiba 21" flatscreen and an
old 1983 RCA XL-100 television, about 25" diagonal)

My Amiga is hooked up to an A520 RGB Convertor, allowing me to drive two
monitors at the same time. They both handle PAL, and they both handle NTSC

(obviouscly)

In standard NTSC, the 21" Toshiba sitting right smack infront of me has a physical dimension of 670 X 436 pixels. If I had a CD32, I could display a 670 X 436 X 262,144 color image on this television, with NO PROBLEM..And I would have no problem viewing the same image on the old RCA television either

It has -nothing- to do with multiscan monitors. Ive never owned a multiscan to begin with--I actually -prefer- composite televisions to do my work. Not only are they cheaper, but the newer televisions manufactured today allow me to have a very sharp picture, to the point where I can lay in bed 20 feet away and read the 80 X 52 text on my screen, such as I see right now.

Since the CD32, A1200 and A4000 offer improved NTSC resolutions, its more than possible for an Amiga CD32 (or any other AGA-chipset machine for that matter) to display nearly DOUBLE that resolution on any standard television.

1536 X 960, 262,144 colors. Of course, if you want higher resolution, you must use a multiscan. But, 1536 X 960 X 262144 colors is still nonetheless displayable in all its glory on any standard TV.

Hmm... I'm not sure about that doesn't the only "compression" from a
ham8 image result from using 8bits instead of 24 to store a pixel?

If so, then I'd say JPEG has quite a bit better compression - you can
easily drag 5:1 or more out of JPEG even at high quality levels.

I have no way of knowing which would look fringier, though!

I agree. I have heard firsthand from several sources who have seen CD^32's FMV
peripheral, and they all agree that its quality is large step above VHS.

Whats even cooler about CD32 is that its FMV adaptor works INDEPENDANTLY of the
actual CD32 unit, so any CD32 owner with the Full Motion Video add-on can play
his games with an -actual- cinematic movie backdrop, considering the CD^32's
AGA chipset allows for internal genlocking..

This means, there is NO slowdown within the CD^32 even while the FMV module is
cranking out full-screen, full-motion, higher-than-VHS quality video..

Imagine playing Lotus Turbo III against the backdrop of an -actual- filmed
movie sequence of England's infamous foggy dirt roads. :)

Lets make this clear once and for all.

1) The Jaguar has NOT been recalled.

2) The CD32 has NOT been recalled.

Of course for a Mac person this would be best... but then again what do Mac people know??? ;) (just a joke!) Anyway, I think that "Cancel" is the safest approach, since it neither loses the data or wastes HD space with lots of "Untitled XXX" files. However, I believe in power to the user, and if the user selects Quit, the default SHOULD be to actually Quit!!!!! If they are so dumb as to not notice the dialog, then they deserve to lose their data. But then again, Apple's market share seems to be all the dumb people in the world... (again :)

Much the same way as Jaguar fans fell for the laughably bloated "850 million
gouraud shaded pixels per second" marketing BS? :)

Like most people, I agree that it is technically unfeasable to have full-motion
video sequences from a -cartridge-, ala Jaguar..Due to the Jaguar's limitation
when it comes to cartridge capacity.

On the other hand, on the Amiga CD^32,such a task is not only possible, but I'd
even go so far as to say -very WELL EQUIPPED- to perform suck tasks due to its
pre-existing CD-Rom.

The numbers of Jaguar users alone is still quite small--the number of Jaguar
users in the future who will buy the supposed CD-Rom addon when/if it is
